MICROFLOTATION, NEW-OLD WATER PURIFICATION TECHNIQUE (MIKROFLOTATION, NYGAMMAL VATTENRENINGSTEKNIK),
K. Roberts.
Kemisk Tidskrift, Vol 86, No 1/2, p 46-48, 1974. 6 fig 7 ref.

Descriptors: *Pulp wastes, *Flotation, *Water purification, *Waste water treatment, Industrial wastes, Waste treatment, Water pollution control, Water pollution sources, Water quality control, Froth flotation, Bubbles, Surfactants, Inhibitors, Supersaturation, Air, Foaming Suspended solids, Carbohydrates.
Identifiers: Xylans, Hemicelluloses.

The application of microflotation to the purification of industrial waste waters, including pulp mill effluents, is described. The process involves supersaturating the waste water with air and then feeding it into a basin at reduced pressure. Tiny bubbles are formed, which carry most of the suspended impurities to the surface. The mechanical and chemical aspects of the process are briefly considered, along with technical possibilities and advantages. Data are included showing the interference of xylan in the process in purifying pulp mill effluents and the elimination of this interference by addition of a surfactant. (Speckhard-IPC)

STUDIES ON THE USE OF OZONE IN WATER AND WASTE WATER PURIFICATION (UNTERSUCHUNGEN ZUR ANWENDUNG VON OZON BEI DER WASER- UND ABWASSERREINIGUNG),
U. Reicherter, and H. Sontheimer.
Vom Wasser, Vol 41, p 369-380, 1973. 3 fig, 7 tab, 19 ref.

Descriptors: *Ozone, *Pulp wastes, *Waste water treatment, *Water purification, *Organic compounds, Degradation(Decomposition), Oxidation, Calcium hydroxide, Chemical precipitation, Natural streams, Humic acids, Water pollution control, Water treatment, Oxygen.

In a study on the use of ozone in oxidative removal of organic substances from waters, a relationship was found between ozone decomposition rate and oxidizing activity. Through ozonization in the presence of calcium hydroxide, a particularly effective removal of organic materials could be obtained. This is explained as being the result of accelerated ozone decomposition in calcium hydroxide solution, as well as of precipitation of partially oxidized organic substances. The radical course of the reaction was confirmed through ozonization of individual substances and isolation of reaction products. The new method was tested on effluent from a pulp mill and on river water with a high concentration of humic acids. (Speckhard-IPC)

CONTROL OF REVERSE OSMOSIS MEMBRANE HYDROLYSIS WITH DYNAMICALLY FORMED WOOD CHEMICAL MEMBRANES,
Institute of Paper Chemistry, Appleton, Wis.
I. K. Bansal, and A. J. Wiley.
Tappi, Vol 57, No 11, p 129-133, Nov., 1974. 5 fig, 4 tab, 4 ref.

Descriptors: *Reverse osmosis, *Sulfite liquors, *Pulp wastes, *Waste water treatment, *Semipermeable membranes, Membranes, Hydrolysis, Tubes, Lignins, Pilot plants, Effluents, Pulp and paper industry, Water pollution control, Waste treatment, Wastes, Industrial wastes, Wood wastes, Membrane processes, Separation techniques, Dynamics.
Identifiers: Cellulose acetate.

The concept of dynamically formed wood chemical membranes was demonstrated for the purpose of extending the capability of commercially available cellulose acetate reverse osmosis modules operating at room temperatures. Two of the reverse osmosis systems employed in these trials were tubular modules, and the third had spiral-wound modules equipped with corrugated spacers. They were operated at 300-600 psig and 35-65 C. Ten tubular and four spiral wound modules had dynamic membranes formed with calcium-base sulfite liquor and were operated at 33-35 C. Data indicated no evidence of membrane hydrolysis over a continuous operation of 7-16 weeks. In a run conducted at higher temperatures, the cellulose acetate membrane in a sand matrix tubular module was periodically coated with soluble wood chemical components contained in certain types of spent pulping liquors. The module was then operated over 280 hr period at 45-65 C. No apparent deterioration in the reverse osmosis performance of the module was observed in terms of the product flux rates and chloride rejections. (Sykes-IPC)

USE OF WASTE CHEMICALS IN KRAFT MILL EFFLUENT TREATMENT,
Finnish Pulp and Paper Research Inst., Helsinki.
W. Jensen, and E. Meloni.
Paper, World Research and Development Number, 1974, p 46, 48-49, 52-54. 14 fig, 5 tab, 17 ref.

Descriptors: *Pulp wastes, *Bleaching wastes, *Waste water treatment, *Wood wastes, *Chemical wastes, Chemicals, Fly ash, Effluents, Bark, Sulfite liquors, Color, Chemical oxygen demand, Costs, Sludge, Industrial wastes, Wastes, Waste treatment, Water pollution sources, Pulp and paper industry, Solid wastes, Coagulation, Chemical precipitation, Filtration, Dewatering
Identifiers: Aluminum sulfate, Ferrous sulfate.

Pine barking effluent, pine kraft pulp screening effluent, and pine kraft pulp bleaching effluent (caustic extraction stage) were treated with aluminum sulfate, ferrous sulfate, and with fly ash from the burning of spent sulfite liquor. Color reductions of about 90% and COD reductions of about 70% were attainable. Dosages to achieve these effects and cost estimates are given. Fly ash is comparable with, or superior to, lime as a treatment chemical. The volumes of sludge produced are greater than those resulting from mechanical treatments, but those from fly ash are easier to filter. Aluminum and ferrous sulfates produce voluminous sludges which are difficult to filter (Hansen-IPC)

POSSIBILITIES FOR PURIFYING RECYCLED OR WASTE WATERS FROM PAPER MILLS, TAKING PHYSICAL-CHEMICAL PROCESSES INTO ACCOUNT (LES POSSIBILITES D'EPURATION DES EAUX RECYCLEES OU RESIDUAIRES DES PAPETERIES, COMPTE-TENU DES PROCEDES CHIMICO-PHYSIQUES),
B. Morgeli.
ATIP (Association Technique de l'Industrie Papetiere) Revue, Vol 28, No 5, p 267-274, 1974. 17 fig.

Descriptors: *Pulp wastes, *Water purification, *Recycling, *Waste water treatment, Floccula-

tion, Filtration, Adsorption, Activated carbon, Separation techniques, Solids contact processes, Biological treatment, Economics, Industrial wastes, Wastes, Chemical oxygen demand, Waste treatment, Water pollution sources, Effluents, Pulp and paper industry.

In purifying papermaking effluents, it is advisable to use a combination of physical-chemical processes particularly suited to the materials contained in the effluents. Pilot-plant and industrial-scale tests have shown that combinations of flocculation, filtration, and activated carbon should preferably be previously freed of substances susceptible to biological elimination; otherwise, these substances will clog the surface pores of the carbon. Biological treatment realized prior to adsorption and after flocculation will increase the adsorption of COD substances on the activated carbon, giving better results and the most favorable economic solution. (Speckhard-IPC)

Bumazhnaya Promyshlennost', No 8, p 13-14, August, 1974. 1 fig.

Descriptors: *Activated sludge, *Sludge treatment, *Sewage treatment, *Coagulation, *Chemical precipitation, *Separation techniques, Waste treatment, Wastes, Water pollution sources, Sludge, Water purification, Lime, Waste water treatment, Dewatering, Water pollution control, Filtration, Iron compounds, Aluminum, Fibers(Plant), Calcium compounds, Dewatering.
Identifiers: Coagulants, Ferric sulfate, Aluminum oxide, Titanium dioxide, Ferric chloride.

The replacement of ferric chloride by other chemicals for the coagulation of excess activated sludge was studied. The agents used in experiments, in which coagulation was carried out on sludge mixed with varying amounts of fibers and fillers (from the primary sedimentation tank), included ferric sulfate, alumina, and a mixed coagulant containing 14% ferric oxide, 4% alumina, 1.5% titanium dioxide, and 10-12% insoluble substances. These coagulants, and also ferric chloride, were used with and without CaO. The effectiveness of the coagulants was evaluated by the filtration rate and resistance to filtration of the sludge. A diagram was constructed from which a suitable coagulant and its dose can be determined. When the resistance is low, the sediment can be dewatered without coagulants. The addition of the fiber/filler mixture makes it possible to use less effective coagulants (e.g., ferric sulfate or the mixed coagulant), because such mixtures reduce the filtration resistance of the sediment. (Stapinski-IPC)

BIOLOGICAL PURIFICATION OF EFFLUENTS FROM BLEACHED KRAFT PULP: THE CASE OF LA CELLULOSE DES ARDENNES (EPURATION BIOLOGIQUE D'EFFLUENTS DE PATE KRAFT BLANCHIE: LE CAS DE LA CELLULOSE DES ARDENNES),
M. P. Henri-Robert, and M. Toulemonde.
ATIP (Association Technique de l'Industrie Papetiere) Revue, Vol 28, No 5, p 275-281, 1974. 3 fig, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Water pollution control, Water pollution sources, Activated sludge, Biological treatment, Water purification, Operations, Technology, Operating costs, Pulp and paper industry, Effluents, Europe, Industrial wastes, Biochemical oxygen demand, Suspended solids, Hardwood, Sludge treatment, Pulp and paper industry, Mixing, Discharge(Water).
Identifiers: *Belgium, Kraft mills.

A Belgian paper mill, originally designed for a production of 200 tons/day of bleached kraft hardwood pulp, was ordered not to discharge more than 1400 kg/day of 5-day BOD. Biological purification has always been necessary, and this effort had to be maximized upon increasing mill production to 500 tons/day. After a study, it was decided to proceed with the construction of a second effluent treatment station in parallel with the original one. Dimensions of the second plant were selected so that the combined plants would function via an activated sludge process with low discharge. The second plant differs from the first in both operation and technology. The need for obtaining a 91% yield involved modifications in activated sludge treatment. To improve control, the process includes reactivation of recycled sludge and contact basins with integral mixing. The volumetric charge retained by the two plants is 0.8 kg/cu m/day. A secondary decanter facilitates sludge thickening takes place in the special primary decanter. Suspended solids in the purified effluent average 90 mg/liter. Although biological purification gives an effective reduction in effluent BOD, there are problems connected with sludge disposal. Operating costs are substantial. (Speckhard-IPC)

Izvestiya Vysshikh Uchebnykh Zavedenii Lesnoi Zhurnal, Vol 17, No 4, p 104-106, 1974. 1 fig, 1 tab, 1 ref.

Descriptors: *Lignins, *Pulp wastes, *Waste treatment, Yeasts, Oxidation, Chemical oxygen demand, *Waste water treatment, Water pollution sources, Water pollution treatment, Pulp and paper industry, Industrial wastes, Wastes, Hydrolysis, Sorption, Solids contact processes, Yeasts, Biological treatment, Pollutants, Sulfite liquors.

The sorption capacity of hydrolysis lignin (screened and washed to remove sugars) was determined by passing the residual liquor through a column filled with lignin and analyzing the fractions collected for oxidizability and COD. From the curves of oxidizability and COD reduction as functions of the liquor ratio (flow rate to saturation of lignin), equations were derived from which the degree of liquor purification can be calculated for any initial COD, flow rate, and liquor ratio. The sorption capacity of lignin for the easily oxidized components of the liquor varied within narrow limits and avaraged 195 g oxygen/kg. The total sorption capacity ranged from 795 to 810 g oxygen/kg. The high sorption capacity of lignin for liquor pollutants that are difficult to oxidize could be utilized as an additional treatment in biological purification of residual liquors. (Stapinski-IPC)

TREATMENT OF RESIDUAL SLUDGES: GENERALITIES AND APPLICATIONS IN THE PAPER INDUSTRY (TRAITEMENT DES BOUES RESIDUAIRES: GENERALITES ET APPLICATIONS A L'INDUSTRIE DU PAPIER),
M. Mathian.
ATIP (Association Technique de l'Industrie Papetiere) Revue, Vol 28, No 5, p 253-265, 1974. 8 fig, 3 tab, 4 ref.

Descriptors: *Pulp wastes, *Sludge treatment, *Reviews, Dewatering, Aerobic treatment, Anaerobic digestion, Drying, Flocculation, Chemical precipitation, Heat treatment, Mechanical equipment, Filtration, Incineration, Costs, Centrifugation, Industrial wastes, Sludge digestion, Degradation(Decomposition), *Waste water treatment, Solid wastes, Operating costs, Economics.

Following a brief description of the main characteristics of sludge from waste water clarifying stages, a review is presented of the main steps in sludge treatment. Covered are thickening, aerobic and anaerobic digestion, drying on sand/gravel beds, conditioning with chemical flocculants, thermal conditioning, industrial units for mechanically dewatering (filter presses, twin-belt presses, rotary suction drum filters, and centrifuges), industrial sludge incinerators (Fluidized-bed, multi-tier, rotating-drum, and flash-drying incinerators), and cost of sludge treatment. (Speckhard-IPC)

MILL ACHIEVES MAXIMUM REUSE OF WATER WITH REVERSE OSMOSIS,
M. MacLeod.
Pulp and Paper, Vol 48, No 12, p 62-64, November, 1974. 3 fig.

Descriptors: *Water reuse, *Water conservation, *Pulp and paper industry, *Industrial water, Waste treatment, *Reverse osmosis, *Waste water treatment, *Wisconsin, Biochemical oxygen demand, Industrial wastes, Wastes, Effluents, Membrane processes, Separation techniques, Water pollution control, Reclaimed water.
Identifiers: Fox River(Wisconsin).

Green Bay Packaging Co. operates a tightly closed neutral sulfite semichemical corrugating medium mill at Green Bay, Wisconsin. An essentially closed white water system, liquor combustion plant, white water surge storage system, and full-scale reverse osmosis unit are integrated in such a way that steady operation is expected to result in less than 5 lb BOD/ton of pulp in the mill's discharge to the Fox River. Some difficulties with the membrane support structure have been experienced. The modules have a life expectancy of only about 2,500 hr, failures occuring especially in the 1,500 to 2,500 hr range. (Sykes-IPC)

NEW SCREENING CONCEPT BOOSTS WATER REUSE AT BOXBOARD MILL,
Sweco, Inc., Los Angeles, Calif. Environmental Systems Div.
W. J. Talley, Jr.
Pulp and Paper, Vol 48, No 11, p 140-141, October, 1974. 3 fig.

Descriptors: *Pulp and paper industry, *Industrial water, *Treatment facilities, *Reclaimed water, *Water reuse, *Water conservation, Cost repayment, Economic justification, Suspended solids, Effluents, Recycling, Waste water(Pollution), Pulp wastes, Equipment, Filters, Filtration, Centrifugation.
Identifiers: Centrifuges, Fiber recovery, White water, Board mills.

Sweco Inc.'s new Centrifugal Wastewater Concentrator (CWC) removes fine particles and fiber from paper machine white water and from mill effluents. Hoerner Waldorf's (St. Paul, Minnesota) paperboard mill installed a CWC in order to reuse combined waste water from felt showers and vacuum seal water on one of its cylinder machines. The cost savings achieved by water recycling, energy conservation, and fiber reuse quickly paid back the initial investment for the unit. (Sykes-IPC)

IMPROVED CLARIFICATION OF BOOK MILL EFFLUENT,
Kimberly-Clark Corp., Neenah, Wis.
Y. C. Wu.

Industrial Water Engineering, Vol 11, No 2, p 22-26, March/April, 1974. 7 fig, 1 tab, 8 ref.

Descriptors: *Pulp wastes, *Enzymes, *Coagulation, *Waste water treatment, Water pollution treatment, Pulp and paper industry, Industrial wastes, Wastes, Waste treatment, *Wisconsin, Hydrogen ion concentration, Polymers, Water purification, Chemicals, Biochemical oxygen demand, Suspended solids, Optical properties, Operating costs, Costs.
Identifiers: *Clarifiers, Alum, Starch.

The feasibility of improving clarifier performance by an integrated enzyme-polymer coagulation system was investigated. Effluent from Kimberly-Clark Corp.'s (Kimberly, Wisconsin) printing paper mill was filtered to remove large suspended matter, and an enzyme (alpha-amylase, beta-amylase, Amzyme TX-8, or malt) was added. After 15 minutes of enzyme reaction, a predetermined amount of alum was added and the mixture, after settling, was analyzed for suspended solids, BOD, optical density, and starch concentration. Alpha- and beta-amylases reduce the dispersing power of starch. Overall performance of an integrated enzyme-polymer coagulation system was not affected by pH and enzyme working time factors, provided the pH of the effluent was between 4.5 and 6.5, and enzyme reaction time was at least 10-minutes. A 5-10% BOD removal reduction was caused primarily by the enzyme addition. For 10 million gallons/day of effluent, the annual savings in total treatment costs are estimated at $4,000 or more, using an integrating enzyme-polymer system (Amzyme TX-8 plus alum), compared to alum alone. (Sykes-IPC)

OZONE: A NEW METHOD TO REMOVE COLOR IN SECONDARY EFFLUENTS,
Welsbach Ozone Systems Corp., Philadelphia, Pa.
C. Nebel, R. D. Gottschling, and H. J. O'Neill.
Pulp and Paper, Vol 48, No 10, p 142-145, September, 1974. 4 fig, 7 tab, 10 ref.

Descriptors: *Ozone, *Pulp wastes, *Water treatment, *Waste water treatment, Oxidation, Color, Chemical oxygen demand, Biochemical oxygen demand, Dissolved oxygen, Water pollution sources, Industrial wastes, Pulp and paper industry, Effluents, Wastes, Laboratory tests, Capital costs, Operating costs, Costs, Economics.
Identifiers: Board mills, Kraft(Pulp) mills.

The high oxidation potential of ozone makes it attractive for treating pulp and paper mill effluents for reduction of color, COD, and BOD. After ozone treatment, effluents are completely saturated with dissolved oxygen, thereby eliminating post-aeration. Since sludge is not generated in ozonization, secondary clarifier and dewatering equipment are not required. The experimental ozonization of effluents from several kraft pulp and board mills is reported. Estimates of daily ozone requirements, capital investments, and treatment costs (ranging from $0.028 to $0.064/1000 gal) are given. (Hansen-IPC)

KNOWLTON (BROTHERS INC., WATERTOWN, NEW YORK) MILL CLOSES LOOP ON WASTE TREATMENT/WATER REUSE,
Malcolm Pirnie, Inc., White Plains, N.Y.
J. R. Folchetti.
Pulp and Paper, Vol 48, No 10, p 116-118, September, 1974. 3 fig, 2 tab.

Descriptors: *Pulp wastes, *Water conservation, *Treatment facilities, *Waste water treatment, *Reclaimed water, *Water reuse, Flocculation, Chemical precipitation, Water purification, Pulp and paper industry, Water quality, Water pollution control, Water pollution sources, Filters, Filtration, Closed conduits, Industrial water.
Identifiers: Photographic paper, Filter paper.

A paper mill which manufactures filter paper and black photographic paper is successfully operating a closed system which reclaims water from mill effluent and returns it to the mill as process water. The development of the system is reviewed. The waste water is pumped to a clarifier/flocculator where chemicals and slimicides are added. The flocculated and clarified waste then flows to a traveling belt filter for polishing and then enters the mill system as reclaimed process water. A flow diagram of the system and water quality data are given. (Hansen-IPC)
W75-03904

EFFECTIVENESS OF THE PRE-AERATOR (EFFEKTIVNOST' RABOTY PRE-AERATORA),
L. B. Pomerants.
Trudy Leningradskogo Tekhnologisheskogo Instituta Tsellyulozno-Bumazhnoi Promyshlennosti, No 30, p 137-143, 1973. 3 fig, 6 ref.

Descriptors: *Pulp wastes, *Aeration, *Treatment facilities, *Waste water treatment, *Efficiencies, Performance, Biological treatment, Nutrients, Water pollution sources, Waste treatment, Microorganisms, Biochemical oxygen demand, Chemical oxygen demand, On-site tests, Bacteria, Pseudomonas, Phosphorus compounds, Nitrogen compounds, Industrial wastes, Pulp and paper industry, Effluents, Carbohydrates.
Identifiers: Baikal pulp mill(USSR).

The second biological purification plant at the Baikal pulp mill receives two types of effluents, the so-called 'black stream' consisting of effluents from the digester room, evaporation plant, yeast plant, and the experimental plant; and the 'white stream' consisting mainly of effluents from the drying plant and the purification equipment of the bleaching plant. These two streams amount to 40,000 and 120,000 cu m/day, respectively. The operation of the new plant is unconventional in that the two streams are pooled and enriched with N and P salts. The residence time in the pre-aerator is up to 20 hr compared to the usual 3 hr. To determine the efficiency of this system, a microbiological study was made of the microflora in the preaerator (which develops spontaneously), and determination were made of the 5-day BOD and the COD. The data were collected during 334 days of plant operation and include seasonal variations in pollution load. The study showed an increase in the number of saprophytic bacteria in the preaerator from an initial 3,000 to 470,000 cells/ml (with the genus Pseudomonas predominating), obviously attributable to the presence of added nutrients. The reduction of BOD in the pre-aerator was 50%, compared to 15% in conventional pre-aerators. The COD was reduced about 30%. Compared to the aeration tank proper, the consumption of N in the pre-aerator at equal reduction of BOD was about 50% lower as a result of a C:N ratio more favorable to the synthesis of non-nitrogenous compounds, such as polysaccharides. (Stapinski-IPC)
W75-03905

CORRUGATED INK AND STARCH WASTES MEET EPA STANDARDS AT ST. REGIS.
Paperboard Packaging, Vol 59, No 12, p 24, 26, 28-29, December, 1974. 7 fig, 2 tab.

Descriptors: *Pulp wastes, *Treatment facilities, *Waste water treatment, Pollutants, *Chemical precipitation, Heavy metals, Water pollution control, Water reuse, Industrial wastes, Filtration, Separation techniques, Waste disposal, Landfills, Oil, Iron, Lead, Nickel, Zinc, Illinois, Water quality standards, Waste treatment, Effluents, Pigments, Color, Pollution abatement, Water pollution sources.
Identifiers: Corrugated boxes, Converting industry, Inks, Starch.

The waste water treatment system installed at the Bridgeview, Illinois, container plant of St. Regis Paper Co. is described. The batch system removes ink pigments, starch waste, oil contaminants, and heavy metals (Fe, Pb, Ni, and Zn) from the effluent. The pollutants are precipitated with chemicals, filtered from the water, and disposed of in a sanitary landfill. The treated water is decolorized in an activated carbon column and either reused in the container plant or discharged to the municipal waste treatment system. The treated effluent meets the State of Illinois criteria for discharge to municipal sewage plants. (Witt-IPC)
W75-03907

STATIC MIXING CONCEPT FOR AERATORS WINS ACCEPTANCE,
Kenics Corp., Danvers, Mass.
G. R. Fisette.
Pulp and Paper, Vol 48, No 10, p 70-72, September, 1974. 4 fig.

Descriptors: *Aeration, *Aerated lagoons, *Pulp wastes, Equipment, Oxygenation, Biochemical oxygen demand, *Waste water treatment, Pollution control, Pulp and paper industry, Water quality control, Waste waters(Pollution), Chemical oxygen demand, Treatment facilities.

A subsurface aeration system applicable to activated sludge and aerobic digestion processes is described. The mixing units are tubes of high-density polyethylene, 1 ft in diameter and 5 ft high, mounted vertically near the bottom of the aeration basin. Air is introduced at the bottom from a header, and helical deflectors inside the cylinders bring about intimate mixing of air and water. A zone of vertical liquid movement is established around each mixer in an array. Data on oxygen transfer rates at various air flow rates are given. In a one million gal basin with 184 aerators, uniform dispersion following the addition of a dye required only 20 minutes. Chemical oxygen demand reduction is over 96%. (Hansen-IPC)

STUDY OF THE SEASONAL EFFECTS ON THE MICROBIOLOGY OF A NORTHERN PULP AND PAPER MILL AERATION LAGOON,
Environmental Protection Service, Ottawa (Ontario).
A. S. Menon, and W. K. Bedford.
Canadian Department of the Environment, Environmental Protection Service Technology Development Report, No. 4-AR-73-1, 53 p, June, 1973. 8 fig, 15 tab, 12 ref, 1 append.

Descriptors: *Pulp wastes, *Aerated lagoons, *Microbiology, *Weather, *Coliforms, *Seasonal, Summer, Winter, Temperature, Nutrients, Treatment facilities, *Waste water treatment, Water pollution sources, Streptococcus, Microorganisms, Lagoons, Oxidation lagoons, Canada, Foreign countries, North America, Stabilization, Pulp and paper industry, Water purification, Biological treatment, Waste treatment, Biochemical oxygen demand, Bacteria, Aquatic bacteria.
Identifiers: Klebsiella, Ontario-Minnesota Pulp and Paper Co.

The second phase of a bacteriological study of Ontario-Minnesota Pulp and Paper Co.'s (Fort Frances, Ontario) waste treatment aeration lagoon assessed whether Klebsiellae and other coliform organisms proliferated in the lagoon and evaluated the seasonal effects on the microbial lagoon flora. The results indicated that the effluents from the separate kraft mill contained only a small number of pollution indicator organisms, but some of these organisms multiplied when entering the lagoon. Coliforms proliferated in the lagoon under both winter and summer conditions. Fecal coliform and Klebsiellae required higher temperatures and complex nutrients for regrowth. They were capable of multiplying in the lagoon only under conditions prevailing during the summer, whereas fecal streptococci did not exhibit any regrowth under either conditions. Coliform reduction in the lagoon

was closely associated with the BOD removal, indicating that coliforms disappeared because some of the readily degradable carbohydrates had been removed, and also because of their inability to compete successfully with other microflora in the lagoon for nutrients. The influence of temperature on the microbial activities in the lagoon is evident from the data showing that larger numbers of various physiological groups were found in summer than in winter. The BOD removal increased from 49 to 65% in summer, indicating that higher temperatures accelerated the microbial process. The majority of the coliforms isolated from the kraft mill effluents and lagoon were Enterobacter strains. A small number of Klebsiellae were isolated. (Witt-IPC)

CRITERIA FOR REGIONALIZATION OF WATER AND WASTE MANAGEMENT SYSTEMS,
Pennsylvania State Univ., University Park. Dept. of Economics.
J. H. Sauerlender, B. V. Dall, J. G. Haltsman, J. Jansma, and S. M. Leadley.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 238, $4.25 in paper copy, $2.25 in microfiche. Pennsylvania Institute for Research on Land and Water Resources, University Park, Research Publication Number 84, June 1974. 70 p, 2 fig, 9 tab, 12 ref, append. OWRT B-035-PA(5), 14-31-0001-3327.

Descriptors: *Planning, *Administration, *Decision making, *Pennsylvania, Financial feasibility, Economies of scale, Alternative costs, *Regional analysis.
Identifiers: Regionalization, *Waste management systems, Community leadership, Waste water plans, Community size, Regional alternatives.

Based on this investigation, the following conclusions were reached: 1. Regionalization of water and waste management systems will not be easy to implement because of Pennsylvania's approach to water management. 2. Regionalization of water management systems is not universally good, but only attractive when economies of scale outweigh added distribution costs. 3. Substantial reductions in costs of wastewater management systems are attainable through regionalization, due primarily to the economies of size encountered in construction, operation, and maintenance of larger systems. 4. The local leadership in the study communities strongly objected to the most economically viable regionalization wastewater plans. The regionalization plans which are most economically attractive are generally not within the scope of what local leaders consider appropriate for their communities. Regionalization plans are somewhat attractive to small communities with no present wastewater system and least attractive to large communities which have some type of wastewater system. 5. More than 12,000 different alternatives exist for combining the municipalities in the study region. A decision-making procedure was developed for reducing the vast number of possible regional alternatives to a manageable number which could be ordered to reflect their priorities at the community level. REGIONAL MANAGEMENT OF WASTE SYSTEMS,
Maryland Environmental Service, Annapolis.
T. D. McKewen.
Journal Water Pollution Control Federation, Vol 44, No 8, p 1493-1497, August 1972.

Descriptors: *Waste water pollution, *Regional analysis, *Water treatment, *State legislation, *Water pollution control, Liquid wastes, Solid wastes, Environmental sanitation, Water treatment, Water law, Water management(Applied), Enforcement, Maryland, Environmental protection, Water resources, Water policy, Water allocation(Policy), Administration, Administrative agencies, Environmental effects, Adoption of practices, Waste water treatment, Conservation, Pollution abatement.
Identifiers: Administrative regulations, State policy.

Many advances have been instituted to deal with the problem of waste management. Agencies such as the Maryland Environmental Service (MES) have been created to facilitate progress. The creation of the federal construction grant program has broken the pattern of exclusive state control of pollution regulation. MES can provide regional waste management where it is needed, financial capability for local areas, and equitable arrangements for waste management between jurisdictions whose respective interests may differ. Maryland's pollution control activities have increased in scope in recent years. By the end of the 1960's, the state government had become an active participant in planning, financing, and operator training in addition to retaining its traditional enforcement activities. It was noted, however, that the state must directly undertake the construction and operation of liquid and solid waste facilities. In 1970, the Maryland state legislature enacted the Environmental Service Act. The Service was directed to develop river basin plans for liquid waste management and regional plans for solid waste management. After the passage of the Act, new federal regulations were promulgated that require each state to have fully developed river basin plans by July 1, 1973. The Service is contributing to local projects pending creation of new regional projects. (Sperling-Florida)

PROBLEM DEFINITION STUDY: EVALUATION OF HEALTH AND HYGIENE ASPECTS OF LAND DISPOSAL OF WASTEWATER AT MILITARY INSTALLATIONS,
Army Medical Environmental Engineering Research Unit, Edgewood Arsenal, Md.
C. A. Sorber, S. A. Schaub, and K. J. Guter.
Available from the National Technical Information Service, Springfield Va 22161 as AD-752 122, $3.75 in paper copy, $2.25 in microfiche. Report Number 73-02, August, 1972. 32 p, 72 ref, 5 append.

Descriptors: *Waste water disposal, *Aerosols, Pathogenic bacteria, Microorganisms, Pre-treatment, *Public health, *Waste water treatment, *Waste disposal, Application methods, Bioindicators.
Identifiers: Land disposal.

The most important variables in the health and hygiene aspects of waste water treatment by land disposal are: the ultimate use of the contaminated waste water; the method of application; and the degree of pre-treatment. These variables have physical, biological, and chemical effects. Waste treatment by land disposal was studied and the following conclusions were made: Many detrimental health and hygiene effects of land disposal would be reduced by proper waste water pretreatment. Biological contamination of groundwater could be avoided by choosing a disposal site with five to ten feet of continuous fine soil. There exists a significant probability of inhaling pathogenic aerosals near a spray irrigation site, Chemical components of sewage can increase the viability of bacteria, virus and protozoans in aerosols; Pathogenic microorganisms may survive longer in sewage aerosols and in soil than common indicator organisms. More mosquito breeding is an effect of ponding in disposal areas. If land disposal is the first step in a water recycle program, total dissolved solids, sodium and nitrate ion build-up in the groundwater can be problems. (Orr-FIRL)

CHARACTERIZATION AND DEWATERABILITY OF WATER TREATMENT PLANT RESIDUES,
Missouri Univ., Columbia. Dept. of Civil Engineering.
J. T. Novak.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 228, $4.25 in paper copy, $2.25 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, October 1974. 64 p, 27 fig, 4 tab, 30 ref. OWRT A-061-MO(1). 14-31-0001-3825 and 4025.

Descriptors: *Waste water treatment, *Sludge treatment, Filtration, Settling, Centrifugarion, Sludge, *Dewatering, Drainage, Water treatment, Drying, Waste identification.
Identifiers: *Chemical sludge, Sand beds, *Air drying.

A variety of water treatment residues were characterized in order to determine the influence of specific chemical constituents, process flow schemes and raw water quality on the performance of sludge dewatering processes. The use of conventional sludge characterization parameters for process selection and design was evaluated by comparing process yields to sludge characteristics. The extent of dewatering was determined for four sludge dewatering methods and the physical properties of chemical sludges at varying solids levels compared to process performance to determine which of the processes produces a 'handleable' sludge. The draining and drying rates of chemical sludges applied to sand beds were related to several sludge characteristics. The time to drain was related to the sludge specific resistance, applied depth and solids concentration. Air drying occurred in two distinct phases. The initial or slow drying phase was governed by the sludge cake depth and drained solids concentration while the rapid drying rate was found to approximate the free surface water evaporation rate. Sludges with a coefficient of compressibility less than 0.7 were found to penetrate into the sand bed.

SOIL ADSORPTION OF HUMIC COLOR,
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
R. A. Miller.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 229, $3.75 in paper copy, $2.25 in microfiche. M.S. Thesis, May 1974. 49 p, 10 fig, 5 tab, 22 ref, append. OWRT A-027-NEB(5).

Descriptors: *Color, Sands, Waste disposal, Biological treatment, *Feed lots, Runoff, Water quality, Soils, *Adsorption, *Chemical oxygen demand, Design criteria, *Waste water treatment, Farm wastes.
Identifiers: *Soil adsorption beds.

The degradation of receiving streams and lakes has prompted many studies on the treatment of feedlot runoff. Various biological treatment systems have been developed to reduce organic strength levels; however, economic color reduction has not been obtained. The main purpose of this study was to evaluate color reduction of feedlot runoff by the process of soil adsorption. Significant reductions in chemical oxygen demand were also anticipated. Conclusions are as follows: (1) color and COD removal from biologically treated feedlot runoff can be obtained by adsorption on clayey fine sand; (2) reduction of color and COD using soil beds is an effective, economical technique for disposal of biologically treated feedlot runoff; and (3) loading rates of 2 inches per day or less and depths of 5 feet or more should be used as design criteria for soil adsorption beds operating full.

ECONOMIC ANALYSIS OF LAND TREATMENT OF MUNICIPAL WASTEWATERS,
North Carolina State Univ., Raleigh. Dept. of Economics.
C. E. Young, and G. A. Carlson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 186, $5.25 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No. 98, October 1974. 98 p, 8 fig, 14 tab, 43 ref, 3 append. OWRT A-072-NC(1). 14-31-0001-4033.

Descriptors: *Cost analysis, *Cost comparisons, Economics, Waste treatment, *Waste water treatment, Ultimate disposal, Sewage disposal, Land management, *Water reuse, *Municipal water, Regression analysis, Waste disposal, *Southeast US, Biochemical oxygen demand.
Identifiers: Wake County(NC), *Land spreading, Land treatment.

The 1972 Water Pollution Control Act Amendments require increased treatment of municipal wastewaters. One method to obtain a high quality effluent at relatively low cost compared to other techniques is land treatment. This study compares and evaluates conventional in-plant treatment and land treatment in a cost framework and in a production efficiency framework. The major objective is to explain why more municipalities have not chosen land treatment in the past. Regression analysis was used to estimate cost functions for 125 municipal treatment plants across the southern portion of the United States. Comparison of the two types indicates that inclusion of land treatment permits higher levels of treatment per dollar of expenditure. The advantages of land treatment are greater for small plants. A .5 million gallons per day (mgd) plant will save $.07 per 1000 gallons treated to 85 percent removal of five-day biochemical oxygen demand (BOD5) if it uses land treatment, while a 10 mgd plant will save $.05 per 1000 gallons. Cost differentials are greater for treatment to 95 percent BOD5 removal. Savings could be increased by 7-15 cents more from sale of by-products from the land site depending upon site characteristics and product prices. The probability of adopting land treatment increases as maximum final BOD5 requirements are lowered, irrigation prices rise, and as stream flow and rainfall become smaller. Land purchase prices were not significant in explaining adoption of land spreading of wastes since only about 40 percent of the land treatment sites purchased land for the purpose of spreading effluent and sludge. The remainder used other public lands or sold or gave the wastes to farmers. (McJunkin-N.C. State)

PHOSPHORUS DETERGENT BAN-HOW EFFECTIVE,
Pieczonka Consultants, Lackawanna, N.Y.
P. Pieczonka, and N. E. Hopson.
Water and Sewage Works, Vol 121, No 7, p 52-55, July, 1974. 1 tab, 10 ref.

Descriptors: *Phosphorus, *Detergents, *Water pollution, *Sewage treatment, Domestic sewage, Effluent control, Eutrophication, Lakes, *New York, *Waste water treatment, Costs.
Identifiers: *Stannous fluoride treatment, Erie County(NY).

The eutrophication rate of a lake is greatly increased by the addition of more nutrient, such as phosphorus. A study in Erie County, New York, attempted to answer basic questions in phosphorus detergent pollution from domestic sewage. The primary questions explored were what percentage of phosphorus reduction could be expected in the influent of a sewage treatment plant treating domestic wastes, and what effect would an effective ban of phosphate detergents have on sewage treatment costs. In domestic sewage, the average phosphorus content is about 10 mg/liter. The rate limiting concentration of phosphorus is about 0.01 mg/liter. It was determined that the enactment of a ban on the detergents would not solve the problem of eutrophication. Phosphorus removal in waste water treatment plants was required. The Lackawanna Sewage Treatment Plant was investigated for further solutions. Composite grab samples were studied for total phosphorus in accordance with the Standard Methods for the Examination of Water and Wastewater. A stannous chloride technique and total phosphate determination were utilized for all phosphorus analyses. It was concluded that phosphorus detergent bans reduced phosphorus loading at a domestic sewage plant by 55.7 percent, although the banning is insufficient for fighting this pollution problem alone. (Leibowitz-FIRL)

OPERATIONAL ASPECTS OF URBAN SEWAGE WORKS,
Leyland Urban District Council (England).
J. Hatfield, K. Ormerod, and C. South.
Water Pollution Control, Vol 73, No 4, p 369-381, 1974. 1 fig, 2 tab.

Descriptors: *Sewage treatment, *Sewerage, *Management, *Design, Sewage districts, Sludge treatment, Sludge disposal, *Waste water treatment, Treatment, *Operations.

Sewage treatment and sewerage works of three relatively small local authorities in Great Britain and their problems of management are discussed. Included are details concerning the division of works within the three authorities, a description of the treatment units at the works, and the management of the labor force employed. It was concluded that where competent management staff are available on sewage works, they should be included in consultations with the persons responsible for the design of treatment plants. More stress needs to be placed on determining the ecologically best method of sludge disposal and on providing the most appropriate treatment method. The small works described can produce results comparable with the results of much larger units when reasonably designed and well run. Smaller works also maintain much of the team spirit and pride of achievement which often cannot be found on larger works. (Orr-FIRL)

PHILADELPHIA PILOTS--BUILDS OXYGEN ACTIVATED SLUDGE,
Philadelphia Water Dept., Pa.
C. F. Guarino, M. D. Nelson, and A. B. Edwards.
Journal of the Environmental Engineering Division, Vol 100, No EE4, p 919-935, August, 1974. 14 fig, 7 tab.

Descriptors: *Activated sludge, Oxygen. *Municipal wastes, *Waste water treatment, Pilot plants, *Pennsylvania, Treatment facilities, *Cost comparisons.
Identifiers: *Oxygen activated sludge. *Philadelphia(Penn).

Philadelphia, Pennsylvania, is expanding all three of its large water pollution control plants. The city has been running oxygen activated sludge pilot plants since March, 1971. UNOX pilot units were operated at each plant. Comparative cost studies between air activated and oxygen activated systems were made. The construction costs and annual costs for the oxygen system were estimated to be $11,060,000 and $1,418,000, respectively. The air system would have construction costs of $13,165,000 and annual costs of $1,506,000. Extensive pilot work indicates that the activated sludge process using pure oxygen is a feasible unit process for treating waste water. During the pilot study, high levels of treatment were consistently achieved even when the organic loading and oxygenation time varied widely. The total cost of a system using pure oxygen is less than that for one using air even though using air has a lower annual cost in the aeration part of the system. The city of Philadelphia has decided to build activated sludge facilities using pure oxygen at two of its plants. The facilities will have capacities of 150 mgd and 210 mgd. (Orr-FIRL)

MIXING IN ANAEROBIC DIGESTION,
Notre Dame Univ., Ind. Dept. of Chemical Engineering.
F. H. Verhoff, M. W. Tenney, and W. F. Echelberger.
Biotechnology and Bioengineering, Vol. 16, No 6, p 757-770, June, 1974. 6 fig, 4 ref.

Descriptors: *Anaerobic digestion, *Mixing, Thermal properties, Hydraulics, *Waste water treatment, Flow, *Indiana.
Identifiers: Hydraulic dead zones, Reaction kinetics, Fluid inflow and outflow, Thermal fluid movement.

Hydraulic dead zones are hazardous to the reaction kinetics involved in anaerobic digestion. An analysis of the significance of thermal fluid movement in the digester to those caused by fluid inflow and outflow is discussed. The principles are exemplified in a digester at the South Bend Wastewater Treatment Plant, South Bend, Indiana. The theoretical estimations are confirmed by experimental measurements. Different types of optimization can be achieved on this operation. One example is the application of this mixing to gas lift mixers. (Leibowitz-FIRL)

WASTEWATER TREATMENT, PHYSICAL AND CHEMICAL METHODS, (LITERATURE REVIEW),
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
F. A. DiGiane, and A. B. Scaramelli.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1109-1121, June, 1974. 1 tab, 131 ref.

Descriptors: *Reviews, *Waste water treatment, *Phosphorus, Water pollution, *Coagulation, *Adsorption, *Nutrients, Polymers, *Filtration, Ion exchange, Reverse osmosis, Disinfection, Biochemical oxygen demand, Ammonia, Solids separation, Nitrogen, Membrane processes, Ozone, Pulp wastes, *Bibliographies.
Identifiers: Physical-chemical treatment systems, Nonionic polyacrylamide polymer, Microstrainers, Sand filters, Ultra-high-rate filtration, Clarification.

Physical-chemical techniques for removing nutrients, biodegradable and nonbiodegradable organics and colloidal suspensions were reviewed. A new physical-chemical plant at Rosemount, Minnesota, consists of pretreatment, clarification, filtration, adsorption, ion exchange, and disinfection; it has a capacity to reduce BOD from 200 mg/liter to 10 mg/liter, and ammonia and phosphorus to one mg/liter. Treatments by coagulation, filtration, adsorption, ion exchange, reverse osmosis, flocculation, sedimentation, foam separation, and carbon adsorption techniques were explored. In one instance, a mobile 18-process, trailer mounted pilot plant was employed to evaluate physical-chemical treatment for effluent quality. U.S. installations where the removal of phosphorus has been achieved and European phosphorus removal by coagulation were compared. Domestic and paper mill waste treatment utilizing the low lime process was examined in both bench and pilot plant studies. Eighty-five percent removal of suspended solids, complete phosphorus removal and 60 percent removal of COD was accomplished by the addition of lime to pH 10.0 and the recarbonation to pH 8.5. Laboratory tests dealing with the removal of phosphorus from laundry wastes indicated that calcium chloride was the most effective precipitant, with optimum removal occurring at pH 10.0. (Leibowitz-FIRL)

FILTRATION ENGINEERING'S SYMPOSIUM ON MEMBRANE SEPARATION,
Filtration Engineering, Vol 5, No 5, p 7-8, 10-12, 14-18, 23-24, 26, 28, July/August, 1974. 7 fig, 1 tab.

Descriptors: *Membrane processes, *Filtration, *Separation techniques, Reverse osmosis, Organic matter, Oil wastes, Colloids, Centrifugation, *Waste water treatment.
Identifiers: *Membrane separation, *Ultrafiltration, Hydrocyclones, Oil emulsions.

Ultrafiltration is defined as a solvent and a solute placed in a pressure side of a membrane. A permeate flows through the membrane with a concentrated solute remaining on the same side of the membrane. The solute may be solids, colloids or various organic molecules. Pore structure and the material of the membrane influence significantly the efficiency of the separation. This is a low-energy separation process, and is an alternative to spray drying, evaporation, selective precipitation and other fine medial filtration processes. Applications of ultrafiltration cover a large range of particle sizes, ranging from ten microns on the high side to ten angstroms on the low side. On the low side the membranes are similar to reverse osmosis membranes. Ultrafiltration's basic characteristic, however, is that the osmotic pressure is extremely low in solution and operating pressures are about 50 psi, whereas reverse osmosis is closer to 500 to 1,000 psi. The flux per unit area is the same or higher than the reverse osmosis separation. Ultrafiltration is less costly than chemical treatment for the treatment of oil emulsions. It involves no chemical usage, therefore adding no pollution to the system. In the General Electric system discussed, a 2.0 percent emulsion is concentrated up to about 50 percent, at the point of combustibility. Because the membrane is only a physical barrier to the passage of oil droplets, the changes in waste characteristics have no effect on the ultrafiltration system's performance. (Leibowitz-FIRL)
W75-04122

AN OVERLOADED SLUDGE PLANT. TRY CHEMICAL TREATMENT,
Hercules Inc., Wilmington, Del.
S. C. Pearson, and R. G. Soltis.
Water and Sewage Works, Vol 121, No 7, p 56-58, July, 1974. 2 fig, 8 ref.

Descriptors: *Sludge removal, *Chemical treatment, *Flocculation, *Waste water treatment, Separation techniques, Solid wastes, Mixed liquor, Digestion, Biochemical oxygen demand.
Identifiers: *Solids transport capacity, Inorganic coagulant, Hydraulic overload, *Clarification.

The solids transport capacity is the sum of two parts, one of which, the capacity due to sludge withdrawal, is alterable by the plant operation. An increase of solids loading on the clarifier from 12 to 16 lb/sq ft/day necessitates that the sludge recycle be increased from 50 to 65 percent to prevent solids carryover. A limited activated sludge recycle capacity can influence the chemical treatment objectives to a large extent. These objectives include the reduction of solids loading on the final clarifiers and maintenance of good solids capture across the final clarifiers in the face of flow increase; both objectives depend upon the accomplishment of maximum BOD removal in the primary basin by adding an inorganic coagulant and flocculant to the raw sewage and by adding a flocculant to the mixed liquor to ensure complete clarification. A flocculant is added to the sludge thickener for the prevention of a hydraulic overload on the digesters. The experiment had three different phases, including the establishment of a baseline by operating the plant at overload with no chemical treatment; the evaluation of the potential flocculation of mixed liquor as the only form of treatment; and full chemical treatment in primary and secondary systems. PLANNED REUSE OF POLLUTED WATERS AND WASTEWATERS,
North Carolina Univ., Chapel Hill.
D. A. Okun.
Effluent and Water Treatment Journal, Vol 14, No 7, p 373-376, July, 1974. 11 ref.

Descriptors: *Water reuse, *Waste water treatment, *Water pollution, *Water management, *Potable water, *Water treatment, Water demand, Water quality, Water pollution effects, Water supply, Quality control, Waste water, Water utilization, Water costs, Water delivery, Water pollution control, Water sources, Waste dilution, Industrial wastes, Municipal wastes, Treatment, Water resources development, Water policy, Water conservation, Conservation.
Identifiers: *Pollution, *Dual supply system, Water Act 1973(England and Wales), Regional water authorities, Regionalization.

While growing population and urbanization is exerting pressure on limited water sources, direct reuse of waste water for drinking may be dangerous. Natural benefits afforded by transit time between points of discharge and recovery, dilution by fresh water, and disinfection by sunlight, sedimentation, and natural biochemical degradation in natural water courses are not present when direct reuse is practiced. Direct reuse poses other problem, including removal of urban chemical contaminants, below-standard facility operation, unavailable technology for analysis and monitoring potable water, lack of fail-safe technology for treatment, and the public's reluctance to ingest its own wastes. One approach to meet water demand is the dual supply system, in which reclaimed waste water is used for non-potable purposes. Benefits of this system include relieving pressure on high-quality water sources, stream pollution reduction, lower costs than for developing new sources, and lower risk of ingesting contaminants. Using polluted waters and waste water for non-potable purposes seems to be the recourse for the future. In addition, water resources and water pollution control authorities must cooperate on a regional basis to plan safe and efficient water reuse. (Grden-North Carolina)

A WATER SEWER PLAN AND PROGRAM FOR THE YOUNGSTOWN-WARREN METROPOLITAN AREA,
Mahoning-Trumbull Council of Governments, Ohio.

September 24, 1970. 27 p, 6 fig, 1 tab, 6 maps, 2 append. HUD P-273, Ohio P-273(G).

Descriptors: *Water distribution(Applied), *Water management(Applied), *Waste water treatment, *Urban hydrology, *Sewers, *Water resources development, *Water management, *Waste water disposal, Sewerage, Ohio, Water supply, Planning, Waste water(Pollution), Sewage districts.
Identifiers: Youngstown(Ohio), Warren(Ohio), Mahoning County(Ohio), Trumbull(Ohio), Mahoning River Management Committee, Northeast Ohio Water Development Plan.

The current state of water sewer development in the Youngstown-Warren Standard Metropolitan Area preliminary to developing a regional water resources management system is described in an initial attempt to draw together hitherto fragmented efforts. The Water Sewer Plan is closely related to and coordinated with Mahoning-Trumbull COG's land use plan and housing plan in recognition of the interrelationship between these factors. Various governmental units have responsibility for water and sewer planning and facilities development. Final responsibility for action remains with individual subdivisions. Coordination for planning has come from the Mahoning-Trumbull Counties Comprehensive Transportation and Development Study which produced the first collection of water and sewer data on a regional basis and the State of Ohio Department of Natural Resources which has been preparing the Northeast Ohio Water Development Plan. An informed group of public and industrial leaders, the Mahoning River Management Committee, has begun development of 'cooperative programs in water resources management between local government and private industry.' Plan objectives include (1) pollution reduction, (2) adequate water and sewer facilities for realistic housing goals, (3) maintenance and/or improvement of existing facilities, and (4) an efficient management system with political responsiveness. The plan also incorporates a provision for citizen participation. Listings, profiles, costs, completion dates and short descriptions of some seventy water sewer projects underway, scheduled or proposed for the area, are provided. (Salzman-North Carolina)

Descriptors: *Economics, *Powerplants, *Thermal pollution, *Cooling towers, Ecology, Environmental effects, Benefits, Costs, Nuclear powerplants, *Alabama, Water pollution, Decision making, Air pollution, Aquatic habitats, *Thermal pollution, Cost-benefit analysis.
Identifiers: Case study.

The use of benefit-cost analyses to aid in decision making is an established practice in water resources engineering. The benefits and costs of recommended technology were evaluated for a case study of Browns Ferry Nuclear Power Plant, Alabama. Economically, the estimated costs exceeded the estimated benefits by about $30,000,000. In impact upon the environment, the cooling towers were more harmful than once-through cooling. There is not enough information available to make definitive statements on the biological damages that would be caused by raising the temperatures of the reservoir approximately 10F instead of 5F. However, all available evidence tends to support the conclusion that the upset of the aquatic flora and fauna would not be devastating in any respect, that it would occur only in a relatively small area in the immediate vicinity of the plant, and that it would not involve any significant, valuable, or endangered species. If significant, unforeseen problems should develop, an off-stream cooling system could then be instituted and the reservoir would return to its original condition. Failure to apply an extensive benefit-cost analysis to the alternatives for controlling thermal releases from the Nuclear Plant clearly resulted in an incorrect and very expensive decision. Each environmental case must be considered and analyzed in its own right. (See also W75-04213) (Humphreys-ISWS)

In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 142-153. 4 fig, 2 tab.

Descriptors: Agriculture, *Experimental farms, *Heated water, *On-site investigations, Irrigation, Instrumentation, Soil temperature, Field crops, Fruit crops, Nuts, Greenhouses, Frost protection, Thermal powerplants, Cooling water, Heating, Soils, *Water reuse, *Thermal pollution.

Highlights were described of a demonstration project, concluded May 31, 1973, that used warmed condenser cooling water for agricultural purposes. The project demonstrated specific methods of using the warmed water. For some applications, i.e., irrigation and plant cooling, such water does not offer significant benefits that can be attributed to its elevated temperature alone; conversely, no damage need be incurred. For frost protection, warm water offers advantages over water at normal temperatures. Warm water use for underground soil heating, in open fields and under greenhouses, shows significant potential for profitable use for selected crops which demonstrated increased yields. A COMBINED SYSTEM CONCEPT FOR POWER GENERATION AND WASTEWATER RENOVATION,
Arizona Univ., Tucson. Dept. of Nuclear Engineering.
R. A. Fazzolare, and R. A. Sierka.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 180-185. 1 fig, 1 tab, 3 ref. OWRT A-044-ARIZ(1)

Descriptors: *Waste water treatment, *Water reuse, *Cooling water, *Heated water, Thermal power, Heat exchangers, Thermal pollution, Heat transfers, Cooling towers, Condensers, Powerplants, Solid wastes, Heat transfer.

Laboratory investigations of a one-step physical-chemical waste treatment process carried out at elevated temperatures indicated performance at least equivalent to conventional secondary sewage treatment. Significantly improved floc and sludge characteristics suggested desirable design parameters for commercial application. Based on these results, a combined power plant-wastewater treatment plant was proposed as a viable engineering concept. Use of waste heat in the wastewater treatment plant was predicted to result in the generation of water for condenser cooling as well as production of additional reusable water. Final handling of the quantities of sewage sludge generated is being investigated. Possible alternatives include use as a fertilizer or for conditioning of arid soils. The progress of mankind is related to his increased understanding of energy and its uses. Energy which exists in mass at potentials above the lowest corresponding potential in the surroundings is considered by man to be available or free, for he has found that with suitable devices he can obtain useful effects greater than his cost by removing the constraints on the energy and allowing it to pass through his device on its way to equalizing with the corresponding lower potential. The proposed cascade system of energy usage recognize that energy needs occur at different potential levels and attempted to maximize the useful effects for man of energy flows. An energy cascade system can be designed most logically by starting with those uses which have outlet conditions at or near the lowest naturally accessible potentials. Then

appropriate energy utilization devices can be inserted which utilize no more of the existing potential than necessary. The cascade method is the reverse of the normal design method. Several illustrations of the cascade type of design were discussed. (See also W75-04213) (Bhowmik-ISWS)

Descriptors: *Aeration, *Air entrainment, *Bubbles, *Turbulence, *Oxygenation, Oxygen, Dissolved oxygen, Water quality, Water analysis, Turbulent flow, Oxygen requirements, Mechanical properties, Mixing, Analytical techniques, Mathematical studies, Instrumentation, *Waste water treatment, Diffusion.
Identifiers: *Oxygen transfers.

Water aeration experiments were conducted to establish, according to classical methodology, the variation of the overall oxygen transport coefficient from air to water in response to: (1) aeration intensity, (2) water height above the aerator, and (3) the aerator orifice diameter. The results of the experiments show that aeration intensity is the main factor controlling the rate of oxygen transport. The important part played by turbulence in the transport process was clearly demonstrated by the increase in specific transport rate per unit contact area caused by increasing aeration intensity. A description of the aerator apparatus used in the experiments was included. (See also W75-04213) (Henley-ISWS)

HYDROGEN PEROXIDE TREATMENT OF EFFLUENT RESULTING FROM WET AIR OXIDATION OF SHIPBOARD WASTES,
Naval Academy, Annapolis, Md. Dept. of Chemistry.
E. Koubek.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-777 096, $3.25 in paper copy, $2.25 in microfiche. Report No. USNA-EPRD-3, February 1974. 10 p, 3 tab, 10 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewage effluents, *Oxidation, Chemical oxygen demand, Chemicals.
Identifiers: Shipboard wastes, *Wet air oxidation, Hydrogen peroxide.

It was proposed that hydrogen peroxide could be used to oxidize or reduce the residual chemical oxygen demand of shipboard waste effluents that have been subjected to wet air oxidation treatment. Studies were made of the effects of various catalysts on the oxidation of acetic acid by hydrogen peroxide, and of acetic acid-peroxide reactions which were irradiated with ultraviolet light. An advantage was claimed for the use of hydrogen peroxide because it adds no new pollutants to the effluents that it treats. (Harmeson-ISWS)
W75-04261

INDUSTRIAL WASTEWATERS, RED RIVER ARMY DEPOT, TEXARKANA, TEXAS,
Army Construction Engineering Research Lab., Champaign, Ill.
J. E. Matherly, R. J. Fileccia, and H. A. Porte.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-778 162, $4.75 in paper copy, $2.25 in microfiche. Technical Report E-24, April 1974. 77 p, 5 fig, 3 tab, 16 ref, 3 append.

Descriptors: *Industrial wastes, Water pollution sources, *Waste treatment, Waste water(Pollution), Water conservation, *Waste water treatment, On-site investigations, Laboratory tests, Costs, *Texas.
Identifiers: Red River Army Depot(Tex).

The volume and character of industrial wastewaters discharged from the motorized vehicle maintenance area of the Red River Army Depot were described. Field and laboratory studies and measurements were made with regard to the character and treatment of wastewater. Design criteria were generated for an industrial wastewater treatment facility that would enable oil and grease removal, phosphate removal, and pH adjustment. This treatment would precede biological treatment in an existing secondary treatment facility at the neighboring Lone Star Army Ammunition Plant. The need for a new gravity wastewater collection system was identified and consideration was given to its congifuration. Existing industria wastewaters were classified according to treatment requirements and methods of collection. Cost estimates for proposed additions and changes to facilities were presented. INTERFACING NEWLY DEVELOPED TECHNOLOGY WITHIN PRESENT WASTEWATER TREATMENT TRAINS,
Hebrew Univ., Jerusalem (Israel). Graduate School of Applied Science and Technology.
G. Belfort.
Journal of the American Water Works Association, Vol 66, No 8, p 504-505, August, 1974. 1 tab, 6 ref.

Descriptors: *Waste water treatment, *Membrane processes, *Water pollution, *Reverse osmosis, Pilot plants, Municipal wastes, Effluents, Economics, Biological treatment, Filtration.
Identifiers: *Pressure-driven membrane processes, Inorganic ions, Conservative constituents.

Much research and pilot plant experimentation is underway to investigate the usefulness of membrane processes for waste water treatment in the pulp and paper, mining, photographic, paint, food and pharmaceutical, textile and electronic industries. Formerly the concern has been with the evaluation of membrane performance or permeator design with different municipal effluents, and the longevity of the system. Advanced processes, being more complicated, cost more to operate, but the rate of treatment is high and land utilization is low. For conventional processes less external energy is required. Traditional biological treatment processes have lower operating and maintenance costs but higher capital investment than the advanced processes including the pressure-driven membrane processes. However, the buildup of constituents resulting from multiple recycling, will have to be considered. Dissolved inorganic ions, refractory organics, and viruses are among the conservative constituents for normal biological secondary treatment. Reverse osmosis is one of the only processes that can totally remove such conservative constituents from the effluent stream. There exist many differences in structure and operation between a specific group of advanced processes (pressure-driven membrane) and the traditional processes for waste water treatment. Research and planning can minimize or avoid potential problems associated with the integration of diverse methods. (Leibowitz-FIRL)
W75-04325

TREATMENT OF CRUDE SEWAGE IN TWO HIGH-RATE ACTIVATED-SLUDGE PLANTS OPERATED IN SERIES,
Water Pollution Research Lab., Stevenage (England).
A. G. Boon, and D. R. Burgess.
Water Pollution Control, Vol 73, No 4, p 382-395, 1974. 4 fig, 4 tab, 11 ref.

Descriptors: *Water pollution, *Effluents, *Sewage treatment, *Activated sludge, Biochemical oxygen demand, Nitrification, Sewage bacteria, Sedimentation, Aeration, *Waste water treatment.
Identifiers: *Settled domestic sewage, *Nitrosomona.

Experiments have determined that during the treatment of settled domestic sewage from Stevenage, England at a temperature of 17 degrees C the growth rate constant ranged from 0.15 to 0.59 d to the minus first power apparently as a result of different degrees of inhibition to the nitrifying bacteria under various conditions of treatment. Recently it has been shown that when treating similar sewage, nitrification is achieved consistently when the wastage rate of the activated-sludge is 0.36 d to the minus first power corresponding to a sludge age of 2.78 d, when the temperature is in the range of 16 to 21 degrees C. The implication is that the growth rate is constant for Nitrosomonas at more than 0.36 d to the minus first power. The average BOD of effluent has been attainable consistently at 50 mg/liter, maintaining at the same time a high-rate of treatment with the activated sludge settling in the final sedimentation stage. Results confirmed that when treating settled sewage in the same plant, the high quality of effluent can be achieved with short periods of aeration of sewage at high sludge loadings, as long as the rate of treatment is not limited by the concentration of dissolved oxygen in the mixed liquor. (Leibowitz-FIRL)
W75-04334

CONTAINING THE FLOW OF SEWAGE SLUDGE.
Environmental Science and Technology, Vol 8, No 8, p 702-703, August, 1974. 1 fig, 1 tab.

Descriptors: *Sewage sludge disposal, *Digestion, Water pollution, Heavy metals, Pesticides, Pathogenic bacteria, Landfills, *Sewage treatment, Florida, Pennsylvania, Fertilizer, Agriculture, Dewatering, *Incineration, *Waste water treatment.
Identifiers: *Sludge incineration, Philadelphia(Penn), Pensacola(Fla).

The Philadelphia Water Department has conducted a simple 'unit' operation for the containment of sewage sludge. The sludge is anaerobically digested and pumped to a lagoon for thickening to about 12.5 percent solids. This thickened sludge is transferred to a 2 million gallon holding barge which is towed out to sea. The discharge of the sludge occurs over a 6 mile course at approximately 30,000 gpm. No lasting harmful effects were determined by a joint study on this process. Because of an increase in ocean and outfall sludge dumping, ocean disposal regulations and restrictions have increased to such an extent that land disposal is expected to increase. Landfilling sites, however, are scarce and expensive, precipitating the old technique of land use of sludge for agricultural needs like soil conditioning and fertilizing supplementation. For example, sludge disposal takes care of 80,000 gpd near Pensacola, Florida. The optimum rate of sludge application for corn, sorghum and soy growth was estimated at 1 inch per week. Cattle fed these grains for 6 months are

to be tested for heavy metal and other toxic substances in the animal' tissues. The U.S. Department of Agriculture is investigating composting and trenching of sludge. Estimates are that primary sludge provide only 1 percent of nitrogen usable for agriculture. Allegheny County Sanitary Authority introduced vacuum filters for dewatering sludge, utilizing the maximum heat, so as to generate steam as a final product by burning a mixture of sewage solids and solid waste materials. (Leibowitz-FIRL)
W75-04336

REBIRTH OF THE SEWAGE FARM.
The Consulting Engineer, Vol 38, No 7, p 49-51, July, 1974. 2 fig.

Descriptors: *Digested sludge, Settling tanks, High-rated heated digestion, Chicago(Ill).

The Metropolitan Sanitary District of Chicago has developed a land reclamation program. Digested sludge is taken by a barge down the Illinois River to Fulton County, 200 miles from Chicago. From this location it is pumped eleven miles underground to reservoirs, then it is sprayed by sprinklers over a portion of 11,000 acres purchased by the MSD. More than 1500 M gallons of sewage is treated each day. The treatment removes 90 percent of the solids in settling tanks, and high-rate heated digestion treats the solids and accompanying liquids. The Chicago district produces approximately 1,000 dry tons of digested sludge. A new scheme of expansion includes the construction of deep tunnels and underground reservoirs for storing storm sewage awaiting treatment. The Muskegon County Wastewater Management System of Michigan is pumping sewage from ten towns through a rising main to a treatment plant north-west of Muskegon. BOD is reduced 70-90 percent by conventional primary and secondary treatment. Vast lagoons store the effluent where solids settle out. The lagoons will be dredged in five years. From the lagoons the effluent flows to an irrigation system where it is disinfected with chlorine. (Leibowitz-FIRL)

APPLICATION OF MICRO-CONTROLLERS MELMIC 100 TO WATER TREATMENT FACILITIES, (IN JAPANESE),
Mitsubishi Heavy-Industries Ltd., Tokyo (Japan).
Z. Moriguchi.
Mitsubishi Denki Giho, Vol 48, No 6, p 750-765, June 1974. 11 fig, 3 ref.

Descriptors: *Waste water treatment, *Water supply, *Sewage treatment, Water quality control, Treatment facilities, *Control systems, Water treatment.
Identifiers: *Micro-Controllers MELMIC 100.

City water service and sewage treatment facilities are becoming larger and more complicated with the upgrading of public welfare and municipal development. Electric equipment makes it necessary to emphasize the reliability and ease of operations. Micro-controllers MELMIC 100 has been developed and manufactured as a static sequence controller with arithmetic counting apparatus. This process promotes the serviceability of the facility. Examples of application are presented for consideration of water treatment systems. (Leibowitz-FIRL)

IRRADIATED FUEL AND CONTROL RODS TRANSPORT FROM A DECOMMISSIONED POWER REACTOR,
Oak Ridge National Lab., Tenn.
W. A. Pryor.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 375-382, 2 fig, 1 tab, 3 ref.

Descriptors: *Nuclear powerplants, *Puerto Rico, *Transportation, *Fuels, *Radioactivity, Ships, Railroads, Safety, Evaluation, Documentation, Comprehensive planning, Radioactive waste disposal.
Identifiers: Fuel elements, Fuel reprocessing, Motor freight, Casks, Shipping containers, Emergency planning, Decommissioning.

The decommissioning of the Boiling Nuclear Superheater (BONUS) Reactor in Rincon, Puerto Rico, involved the transport to the continental United States of irradiated fuel elements as well as the shim and control rods for reprocessing and disposal, respectively. The responsibility was assigned by the USAEC to the Oak Ridge Operations Office. Tasks included cask selection, cask and special equipment preparation, transportation arrangements, documentation, and shipment execution. Safety considerations were factored into each phase and Safety Analysis Reports were prepared for the cask and for the fuel and control rod baskets. Trial runs with the cask and special equipment were conducted prior to shipment to Puerto Rico. The applicable regulations of the USAEC and the Department of Transportation were followed. The completed task represented the cooperative efforts of two USAEC Operations Offices and two USAEC prime contractor organizations. (See also W75-04152) (Houser-ORNL)

DISPOSAL/RECYCLE MANAGEMENT SYSTEM DEVELOPMENT FOR AIR FORCE WASTE PETROLEUM OILS AND LUBRICANTS.
Esso Research and Engineering Co., Linden, N.J
Available from the National Technical Information Service, Springfield, Va 22161 as AD-779 723, $5.75 in paper copy, $2.25 in microfiche. Report No. AFWL-TR-73-283, April 1974. 126 p, 14 fig, 16 tab, 46 ref, 2 append. F29601-73-C-0047.

Descriptors: *Oil wastes, *Waste disposal, *Management, Fuels, *Lubricants, *Oil pollution, Surveys, Military reservations, Unit costs, Economics, Ultimate disposal, Incineration, Recycling, Education, Organic compounds.

The problem of disposing of waste lubricants and contaminated fuels generated at Air Force bases was addressed. The nature and rates of generation of several waste petroleum products such as lubricating oils, hydraulic fluids, and contaminated jet fuel were considered. Present Air Force waste petroleum oils and lubricants (POLs) practices were reviewed including a description of operations at Kelly and Andrews Air Force Bases. Waste POLs data for other bases, generated by questionnaire, were also reviewed. Disposal/recycle options were identified and discussed. A general procedure for developing an effective waste POLs disposal system, for any Air Force installation, was presented, including disposal decision making criteria and the disposal decision making process. Hypothetical examples, illustrating the mechanics of the procedure, were presented. The importance of a carefully planned program for implementing the developed waste POLs/disposal procedure was described including education of base personnel, enforcement of waste product segregation, and management. Considerably high waste product values can be realized by the implementation of the described procedure. (Humphreys-ISWS)

IS THE WATER SAFE TO DRINK. PART 3: WHAT YOU CAN DO,
Environmental Defense Fund, Washington, D.C. Water Resources Program.
R. H. Harris, and E. M. Brecher.
Consumer Reports, Vol 39, No 8, p 623-627, August, 1974.

Descriptors: *Water quality standards, *Water pollution control, *Environmental control, *Potable water, Public health, United States, Water treatment, Social participation, Water purification.

There is a great need for assuring the purity of drinking water being piped into homes and businesses by some 40,000 community water systems in the United States. Methods for achieving a higher standard of water quality were discussed in two previous articles. The role of the individual citizen is now in focus. Recommendations for reducing one's heavy metal contamination intake are as follows: let water run for a minute or so after several hours of nonuse; avoid using hot water for preparing infant's formula or cooking since hot water tends to be higher in heavy metal content, although boiling is essential for water which is frequently contaminated by bacteria; and most importantly, organize citizens groups to demand the upgrading of water quality from the community supplies while being prepared to pay the price of purification. INSTITUTIONAL FRAGMENTATION AND POLICY INNOVATION: THE CASE OF FEDERAL WATER POLLUTION CONTROL,
Arizona Univ., Tucson. Inst. of Government.
H. M. Ingram, S. J. Ullery, and B. A. Wright.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-239 105, $9.25 in paper copy, $2.25 in microfiche. Completion Report, January 1975. 316 p. OWRT B-034-ARIZ(1). 14-31-001-4057.

Descriptors: *Water policy, *Political aspects, *Administrative agencies, *Legislation, Institutional constraints, Instition, *Federal Water Pollution Control Act, Legal aspects, Costs, Water pollution control.
Identifiers: Institutional fragmentation, Policy innovation, *Decentralization.

This research questions the assumption that the fragmentation of institutional arrangements in water resources necessarily leads to distributive, incremental policy. It investigates the possibility that fragmentation and the miltiplicy of actors and decision centers associated with a decentralized legislative system is appropriate to innovation and responsiveness of policy. Federal Water Pollution Control Policy from 1956 to 1972 is the focus of analysis. A framework for monitoring innovations in policy content as perceived by key actors is applied to landmark bills. The study concludes that water pollution control bills have been composites of different dimensions and that policy change has occurred unevenly through time. The patterns of legislation-building and consent-building on the 1956, 1965 and 1972 bills are described in detail. The report concludes that the fragmented, decentralized - Congress is especially well suited to innovations in complex, multidimensional legislation.
W75-03851

PUMPING APPARATUS FOR SKIMMING AND RECOVERING AN OIL LAYER FROM A BODY OF WATER,
Patents and Developments A/S, Nesttun (Norway). (assignee)
F. Mohn.
US Patent No 3,853,767, 3 p, 2 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 929, No 2, p 775, December 10, 1974.

Descriptors: *Patents, *Skimming, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, *Separation techniques, Pumping, Equipment.

An oil pump is surrounded by a bowl or disc, the periphery of which is adapted to be positioned exactly at the plane of separation between water and oil. This precise adjustment can be done by means of the adjustable floats. The periphery of the disc will then, when correctly positioned, effect the first separation of oil from water. The oil pump is disposed in the center of the bowl or disc and, in order further to separate the oil from the water also at the center portion of the bowl, a chamber may be provided having inlets which are aligned with or somewhat lower than the periphery of the bowl, the oil concentration over the central portion of the bowl being substantially greater than that outside. In order that the oil-covered water can be brought to the bowl in large amounts, a plate is arranged beneath the bowl which is provided at its center with a powerful pump for circulation of the water. When this pump is in operation, large amounts of surface water will be drawn toward the bowl and the plate and, on flowing over the plate to the pump, the oil will trickle over the periphery of the bowl together with very small amounts to water. The water is drained from the central portion of the bowl through channels which open toward the plate. (Sinha-OEIS)
W75-03865

USE OF SULFUR FOR COMBATTING OIL SPILLS,
Amoco Production Co., Tulsa, Okla. (assignee)
L. W. Jones.
US Patent No 3,844,941, 5 p, 11 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 2093, October 29, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, *Water pollution control, *Sulfur, *Separation techniques, Gravity.
Identifiers: Gravity separation.

A system is described for combatting the problems which occur when oil is spilled upon a body of water. Sulfur is spread over the spilled oil to hold the oil mass together to permit it to be easily removed from the body of water. Molten sulfur is sprayed as very fine strands over and around the periphery of an oil spill to enmesh the oil in a sulfur web and keep it confined. In another embodiment, sulfur powder is spread over the oil and tends to hold it together. In those cases where sinking of the oil is the most practical solution to the oil spill problem, greater amounts of powdered yellow sulfur, e.g., at least about three parts by weight of sulfur to one part crude oil, is applied. The oil captured by the sulfur is easily recovered with the sulfur and separation of the oil and sulfur is easily obtained by heating and gravity separation. (Sinha-OEIS)
W75-03869

SKIMMING APPARATUS,
L. Bagnulo.
US Patent No 3,853,768, 4 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 929, No 2, p 776, December 10, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, *Skimming, Flotsam, Equipment, Separation techniques.

A chamber is adapted to be partly submerged in a body of liquid. Means are provided for admitting liquid into the lower zone and the liquid in the chamber is maintained at a height sufficient so as to allow substances flowing on the admitted liquid to rise into the float inside the upper zone. Skimmed liquid is discharged at a lower portion of the lower zone and the floating substances are removed from the upper portion. (Sinha-OEIS)
W75-03870

APPARATUS AND METHOD FOR EFFECTING SEPARATIONS,
L. Mercuri.
U.S. Patent No 3,844,944, 4 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 2094, October 29, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution control, Water quality control, *Separation techniques, Gravity, Equipment, Pollution abatement.
Identifiers: *Gravity separation, Immiscible liquids.

A series of separation chambers is provided each of which, in a downstream fashion, is shorter in height or is at a lower point relative to gravity than its preceding separation chamber. Separations occur in a given chamber and water which has been treated is passed from it to the next lower chamber for further treatment. At each stage the pollutant is removed until potable or pollutant-free water is obtained. The removal of oil or other pollutant is effected by allowing it to flow into the hold of a ship or by passing it to some other reservoir. The water that emerges at the final stage contains little or no oil or other pollutant, and is allowed to flow directly back into the sea, lake or river in a continuous fashion. The method and apparatus provides the separation of oil and water

without the use of any counterflowing processes or turbulence effects. The flow of the liquids is in effect in a straight continuous line. There are no reversals of flow nor are any tortuous paths of liquid travel needed. The separation containers are of sufficient size to accommodate large quantities of liquids, and the filling of the initial container and the continuous pumping of materials into it can be at a rate that is commensurate with the separations that are occurring in the successive containers. Visual gauges can be place on each of the containers to allow ready observation of the status of the mixture in each container. (Sinha-OEIS)

AN ALARMING SYSTEM FOR HIGH-SOLIDS WHITE WATER,
M. MacLeod.
Pulp and Paper, Vol 48, No 11, 116-120, October, 1974. 8 fig.

Descriptors: *Pulp wastes, *Monitoring, Discharge(Water), Water pollution sources, *Wisconsin, Effluents, Pulp and paper industry, Conductivity, Pollution abatement, Waste water(Pollution), Water pollution control, Dissolved solids, Closed conduits, Sewers, Instrumentation.
Identifiers: *White water.

Green Bay Packaging Co. (Green Bay, Wisconsin) produces about 200 tons/day of neutral sulfite semichemical pulp which is combined with recycled waste paper to make about 300 tons/day of corrugating medium. A monitoring and information system has been installed to indicate when and where process upsets occur in a closed mill system. Conductivity sensors in the monitoring system will detect the intrusion of high dissolved solids white water into the clean sewers, since conductivity has been found to correlate well with dissolved solids in the mill's effluent stream. A leak of white water into a clean sewer will be discovered by one of the six strategically located conductivity sensors which will then set off an alarm on the annunciator panel in the paper tester's laboratory. (Sykes-IPC)
W75-03901

HOW TO REDUCE BOD LEVELS FROM SIZE-PRESS STARCHES,
National Starch and Chemical Corp., New York.
K. Bristol.
Pulp and Paper, Vol 48, No 10, p 98-99, September, 1974. 2 tab, 2 ref.

Descriptors: *Pulp wastes, *Pollution abatement, *Biochemical oxygen demand, *Water pollution sources, Hydrogen bonding, Water pollution control, Pulp and paper industry, Chemicals, Additives, Costs, Economics.
Identifiers: *Starch, Sizing agents, Size-press(Paper machine).

In paper mills using starch at the size-press, a significant amount of the starch can return to the wet-end with recycled broke. Anionic or nonionic starches are not retained on the fibers on repulping, but are dispersed in the white water and eventually leave the mill in the liquid effluents, contributing to BOD. Cationic starches, which bond to fibers electrochemically, rather than by hydrogen bonding, tend to stay with the repulped fibers and contribute substantially less BOD to mill effluents. Cases are cited illustrating this effect, as well as cost reductions in secondary treatment attributable to the use of cationic starches. (Hansen-IPC)

The United States government charged the defendant corporation with violation of the Rivers and Harbors Act by making a discharge of coal tar into a river. Immediately after the discharge had occurred, the defendant had notified the Coast Guard, pursuant to its obligation under the Water Quality Improvement Act of 1970. The government filed a criminal information against the defendant, based upon facts contained in the notification and facts obtained during subsequent investigation. The defendant moved to suppress this evidence, relying upon section 11 of the Water Quality Improvement Act, which provides that information derived from notification made pursuant to statute by any 'person in charge' shall not be used against 'such person' in prosecution for violation of antipollution laws. The United States District Court granted the motion and dismissed the case. The Sixth Circuit Court of Appeals affirmed the lower court's holding, and ruled that the statutory safeguard applied to corporations as well as natural persons. The court added, however, that any prosecution based on evidence other than the notification or information acquired by exploration of such notification was not excluded by the statutory safeguard. NATIONAL DRINKING WATER STANDARDS.
Journal Water Pollution Control Federation, Vol 45, No 8, p 1637-1638, August 1973.

Descriptors: *Water Pollution Control Act, *Federal legislation, *Water quality control, *Water quality standards, Water requirements, Enforcement, Water control, Maintenance, Water pollution control, Administrative agencies, Water resources development, Adoption of practices.
Identifiers: *Safe Drinking Water Act of 1973.

After passing the Water Pollution Control Act Amendments in 1972, Congress began considering the question of national drinking water standards. Several states have adopted standards established in 1914 by the Public Health Service for drinking water quality. These standards have been updated several times, the latest revision was in 1962. Drinking water is contaminated by various sources, and contamination has been found in many regions. On June 22, 1973, the Senate passed the Safe Drinking Water Act of 1973 which gives the Environmental Protection Agency (EPA) the power to set maximum limits on the level of contaminants permitted in drinking water and to enforce those standards if the states fail to do so. The bill also directs the EPA to develop rules for the operation and maintenance of drinking water systems. The EPA administrator will be required to propose nationwide primary and secondary drinking water standards within 180 days of the law's enactment. Enforcement of standards will be the responsibility of the individual states. EPA may step in if states fail to act. Federal funding is provided to assist the states in establishing and maintaining their programs and to support research. Penalties for violations are set forth (Sperling-Florida)

CUTBACK IN COSTRUCTION FUNDING STIRS DOUBT ON WATER QUALITY GOALS.
Journal Water Pollution Control Federation, Vol 45, No 2, p 199-202, February 1973. 1 fig.

Descriptors: *Water pollution, Abatement, *Impaired water quality, *Water pollution control, *Pollution abatement, *Navigable waters, Wildlife management, Fish resources, Waste treatment, Aquatic environment, Legislation, Water law, Water quality control, Research, Technology, Water resources development, Waste water treatment, Conservation, Wildlife resources, Environmental effects, Water policy, Adoption of practices.

President Nixon vetoed the $25 billion water pollution control bill. After Congress overrode the veto, the President impounded $6 billion of the $11 billion authorized by Congress for water pollution control grants in the next two fiscal years. The bill provides for the elimination of the discharge of pollutants into navigable waters by 1985; protection of fish, wildlife, and recreation; application of technology to achieve secondary treatment for publicly owned treatment works; and the application of technology to produce the best practicable waste treatment. Expenditures for contract grant authority are set forth in the act. State allocations will be made on the basis of need rather than population. The impoundment of funds has given rise to a difference of opinion concerning its possible effects on the water pollution control effort. One side feels that the decrease in funding will have little effect on the purposes of the act while the other side feels that without funding, the entire law becomes useless. Spokesmen from various states agree that the allocation of money is the controlling factor in the Nation's ability to control water pollution adequately. (Sperling-Florida)

THE PHILOSOPHY OF S.2770,
Senate, Washington, D.C.
E. S. Muskie.
Journal Water Pollution Control Federation, Vol 44, No 3, p 522, March 1972.

Descriptors: *Legislation, *Water pollution control, *Water quality standards, *State governments, Ecology, Federal government, Effluents, Conservation, Water quality control, Water quality, Water pollution sources, Waste water disposal, Waste water treatment, Legal aspects, Water Quality Act, Permits, Waste water disposal, Regulation, Specifications, Water law, Political aspects, Environmental sanitation.
Identifiers: *Federal Water Pollution Control Act Ammendments of 1972.

The Federal Water Pollution Control Act Amendments of 1972 propose a major change from water quality standards to effluent limits for the federal water pollution control system. It is virtually impossible to establish a precise relationship between an effluent and water quality except where a single source of pollution contributes the entire waste load to the receiving water. The Refuse Act of 1899 provides a convenient way to take polluters to court for discharging without permits. The most effective way to stop pollution of the waterways is to stop the discharge of pollutants into receiving waters. The Senate recommends this goal be reached by 1985. Critics say there are technical and economic limits on the degree to which the discharge of pollutants may be stopped. Reasonable costs is the basic test under this law, for eliminating discharges. The target date is intended to spark the research and development of the technology now lacking. The law gives the states an opportunity to take the lead in setting effluent limits within the context of a national law that insures against capricious and uneven application of that law. WPCF ADOPTS RESOLUTIONS AIMED AT EASING PROBLEMS OF WATER LAW.
Soap and Detergent Association, New York.
Water in the News, Soap and Detergent Association, New York. p 1-2, November-December 1974.

Descriptors: *Water pollution, *Water treatment, *Water law, *Administration, *Federal government, State governments, Water policy, Water pollution control, Water quality standards, Government finance, Cost-benefit analysis, Construction, Planning, Administrative agencies, Permits, Industrial wastes, Governmental interrelations, Evaluation, Long-term planning.
Identifiers: Environmental policy, Effluent limitations.

At the forty-seventh annual conference of the Water Pollution Control Federation recommendations were made for more effectively dealing with problems of water law and administration. It was suggested that primary authority be shifted from the federal government to the states. Policy in regard to secondary treatment standard and effluent limitation should be revised to insure that local conditions and cost effectiveness be considered. Federal funding for construction grants and state programs need to be at adequate levels and as such the commitments need to be long term without vacillations in funding. Among administrative recommendations are that funds commensurate with documented needs for research, manpower, and training be sought and utilized, and that the use of delegating mechanisms be broadened to reduce staggering paperwork demands. The administrator of the Environmental Protection Agency reported that the bulk of major permits for both municipal and industrial dischargers will be issued by the end of the year. STANDARDS, ADMINISTRATION, AND SURVEYS, (LITERATURE REVIEW),
Delaware River Basin Commission, Trenton, N.J.
R. Porges, and S. P. Gross.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1625-1643, June, 1974. 216 ref.

Descriptors: *Water pollution control, *Federal Water Pollution Control Act, Standards, Administration, Surveys, Water quality standards, Biota, Wildlife, *Bibliographies, *Reviews.

Water quality standard guidelines for revision and general development under the Federal Water Pollution Act Amendments of 1972, as applied to interstate and intrastate waters were published by EPA. Objectives, goals, policy guidelines, legislative requirements and other salient issues were examined. Revised water quality standards were proposed for the naviagable waters of Illinois, West Virginia, Puerto Rico, New Jersey, and New York. The National Academy of Sciences-National Academy of Engineering's Environmental Studies Board has completed a revision of 'Water Quality Criteria' issued in 1968. Criteria for six classes of water uses, such as recreation and aesthetics, public water supplies, both fresh and marine water aquatic life and wildlife, agricultural use and industrial supplies, were established. Criteria were presented in numerical and verbal form for the physical, chemical, biological and esthetic determinants of water quality for the six uses. The Federal Act required the EPA to publish criteria for water quality and information for restoration and maintenance of aquatic integrity, and water measurement and classification. The development of effluent limitation guidelines is examined. Level I technology was based on the average of the best performance by plants of different sizes, ages, and unit processes in each industrial category. (Leibowitz-FIRL)

POLLUTION CONTROL IN JAPAN-A SURVEY.
Process Biochemistry, Vol 9, No 5, p 15, 34, June, 1974. 1 tab.

Descriptors: *Water pollution, Water pollution sources, Pollution abatement, *Water pollution control, Equipment, Foreign countries, *Legislation, Planning, Water resources development, *Regulation, Water quality standards.
Identifiers: *Japan.

The overall picture of water pollution in Japan is very serious, in both Japan's fresh and marine waters. The Anti-pollution Act of 1970 is one of the most comprehensive environmental protection laws. It is a framework of definitions and plans of action. The two series of effluent standards set for water quality are for protection of health and for environmental preservation. The pollution control market is one of the fastest growing areas in the Japanese economy. The market has been mainly concerned with solving existing problems, developing, purchasing and marketing the existing technology. However, the development of preventive measures is becoming more important. The developments are in three areas: new recovery techniques; the detailed application of these and existing technology to specific industrial problems; and the redesign of processes to avoid initial pollution. Identifiers: *National Environmental Policy Act.

Legislative and regulatory developments at the Federal level concerning environmental control are reviewed. The Clean Air Act Amendments of 1970 gave the EPA authority to establish safe ground level concentrations of air pollutants, and to enforce achievement of such levels through the application of controls. EPA has promulgated two sets of ambient air quality standards, specifying maximum acceptable ground level concentrations of pollutants. Primary standards are those strict enough to protect public health. These standards are to be reached nationally by 1975, regardless of expense. Secondary standards represent the protection of the public welfare. These standards specify levels necessary to protect vegetation, animals, and materials from hazardous contamination; national attainment is expected sometime between 1978 and 1980. State ambient air quality standards will also have to be met, and in some

cases, with greater rigidity. Since the enactment of NEPA, significant progress has been made. Legislation now pending should provide a basis for effective land-use control. New equipment and technology has had a significant impact on industrial waste quality, evidenced in increased expenditures since 1970. The power facility siting process is an indication of progress in the environmental area. Development of a national land-use policy and more specific interpretations of existing regulations would enhance environmental protection. (Leibowitz-FIRL)

Descriptors: *Law enforcement, *Federal Water Pollution Control Act, Water pollution, Water quality control, Waste water treatment, Effluent control, Groundwater, Management, *Bibliographies, *Reviews.
Identifiers: Citizen suits, Federal water quality legislation(Pre-1972).

The amendments of 1972 to the Federal Water Pollution Control Act dominated the literature concerning federal efforts in water quality control. The inadequacies of past federal efforts in this area and the important parts of the new amendments were discussed by McMahon. Rasmussen and Kuchenbacker concluded that the improved enforcement procedures, including citizen suits, the right to enter and monitor effluent discharge, and the new permit program, should have a significantly positive effect on the curbing of water pollution. Coleman, on the other hand, criticized the new amendments, considering the possibility of the development of problems like those imputed to the Clean Air Act, such as alleged blackmailing of the states by the EPA. The amendments use of technologically-based standards was criticized by Rauch, who then concluded that this policy, and its cost factors, would perpetuate a negative incentive for the technological development necessary to meet the final goal. Finnell examined the Florida Environmental Land and Management Act of 1972. The trust doctrine of Virginia's new constitution dealing with natural resources was examined by Brion. (Leibowitz-FIRL)

EPA'S POLLUTION CONTROL GOALS TAKE BROADSIDE IN SEATTLE.
Engineering News Record, Vol 193, No 5, p 15, July 25, 1974.

Descriptors: *Water quality control, *Water pollution control, *Waste water treatment, Economics, Pacific Coast region, Water policy, Biochemical oxygen demand, Water quality standards, Tertiary treatment.

The federal water pollution control program came under fire in Seattle from public officials. John D. Parkhurst of the Water Pollution Control Federation attacked what he claimed was the 'economic madness' of the EPA's standard for secondary treatment. The general manager of the Los Angeles County Sanitation District predicted the secondary treatment would cost more than $100 billion. Richard S. Page, executive director of the Municipality of Metropolitan Seattle, claimed that the 85% removal of BOD required by the EPA would produce no significant benefit to the quality of water on the Pacific Coast. The director asserted that $650 million would be needed to meet this requirement on the Pacific Coast alone. (Leibowitz-FIRL)

ON POLLUTION CONTROL.
New Civil Engineer Special Review, Vol 95, p 53, May, 1974.

Descriptors: *Water pollution control, *Oil spills, *Oil pollution, Legislation, Water quality control, Pacific Coast region, Regulation, Continental shelf, Atlantic Ocean.
Identifiers: Santa Barbara channel(Calif), North Sea, Continental Shelf Act of 1964, Petroleum Regulations of 1966, Prevention of Oil Pollution Act of 1971.

California waters suffered from an excess of pollution in 1969. In the Santa Barbara channel 100,000 barrels of crude oil were spilled due to a blowout. Further eruptions necessitated the sealing of the fissure in March, with continued seepage following for longer than a year. In December, a 120 sq km oil slick developed from a Union Oil pipeline break. A ban on oil drilling was then instituted by the state of California. Because of environmental protest, not much more than seismic surveys have been done in the U.S. Atlantic or Pacific continental shelves. Legislation covering pollution control in the UK sector of the North Sea is the Continental Shelf Act of 1964, which makes the discharge of oil from drilling and production operations in that area an offense, with a license dependent upon the operator's liability for control of any such discharge. The Petroleum Regulations of 1966 recommend that oil escape into licensed waters be avoided by all necessary preventive measures. Relevant legislation was later added in the form of the Prevention of Oil Pollution Act of 1971. (Leibowitz-FIRL)

ADDITIONAL STUDIES OF THE EFFECTS OF SALT MARSH IMPOUNDMENTS ON MOSQUITO POPULATIONS,
North Carolina State Univ., Raleigh. Dept. of Entomology.
J. C. Dukes, R. Axtell, and K. L. Knight.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 235, $3.75 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Report No. 102, December 1974. 38 p, 15 fig, 14 tab, append. OWRT B-057-NC(2). 14-31-0001-3919.

Descriptors: *Mosquitoes, *Mosquito control, Impoundments, Public health, *Salt marshes, Flooding, Water level fluctuations, *North Carolina, Vegetation, Water pollution control.
Identifiers: Carteret County(NC), *Aedes sollicitans, Juncus marsh, *Anopheles mosquitoes.

A comparative study of three adjacent areas (a natural marsh, a partially completed impoundment, and a completed mosquito control impoundment) evaluated the effectiveness of an impoundment for salt marsh mosquito control. Potential mosquito producing sites in both the natural marsh and the partially completed impoundment were comparable in vegetative cover. Neither area produced mosquitoes - the natural marsh was inundated by tides too often; in the partially completed impoundment, the dikes eliminated normal tidal flooding. Within the impounded marsh, Juncus roemerianus Scheele (black needlerush) remained in several large stands. However, in vast areas, only stumps of Juncus remained. Most of these and other marginal areas had been invaded by Typha spp. (cattail). Numerous patches of Spartina patens (Aiton) and Distichlis spicata (L.) were still thriving around the perimeter of the dike and on high ground within the interior. Only two larvae of the salt marsh species Aedes sollicitans (Walker) were recovered within the impoundment. Anopheles mosquito larvae were collected in small numbers from areas containing thick mats of vegetation (Spartina patens, D. spicata and B. monnieri) and flooded with less than six inches of water. During summer months, the water level dropped 6 inches due to evaporation, causing most mosquito breeding sites to become unproductive. Areas in deeper water, or where the vegetation was submerged, were not mosquito producers. Salinity within the impoundment was 0 parts per thousand throughout the entire research period. The Cleveland area has three interdisciplinary research teams which are studying the pollution of Lake Erie. Water pollution library materials are distributed in various locations and with varying subject classifications. A special library collection was established in the university library, and the complexity of identifying and collecting reports in the field of environment, along with locating other water pollution agencies and recording locations of other local collections of data are elucidated. The functions of the Lake Erie Study Collection as a special library are considered in relation to the project members' research. (Leibowitz-FIRL)

CONSIDERATION OF BACKGROUND IN DEVELOPMENT OF ENVIRONMENTAL STANDARDS,
Georgia Inst. of Tech., Atlants. Office of Interdisciplinary Programs.
A. A. Moghissi, and M. W. Carter.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tenn., p 17-22, 1 tab, 1 ref.

Descriptors: *Radioactivity, Environment, *Human population, *Standards, *Safety, Evaluation, Assessment, Background radiation, Geographical Regions, Geology.
Identifiers: *Environmental standards.

Environmental standards for a class or for individual pollutants are usually derived from animal and human biological effects and kinetics data and/or in comparison with background levels. Once such standards are adopted they are applied to the entire nation without considering the signifi-

cant differences in background levels in various geographical locations. Fallacies of this approach are identified and described using the example of environmental radiation standards. (See also W75-04152) (Houser-ORNL)

FUNCTIONAL PLAN FOR WATER SUPPLY AND WASTE WATER DISPOSAL FOR THE SANTEE-WATEREE PLANNING DISTRICT,
LBC and W Consultants, Columbia, S.C.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-226 790, $4.75 in paper copy, $2.25 in microfiche. Prepared for Santee-Wateree Regional Planning Council, Sumter, S.C. June, 1973. 84 p, 8 fig, 5 append. HUD SC-04-12-1003.

Descriptors: *Water utilization, *Costs, *Water supply, *Water management(Applied), *Sewage systems, *Waste treatment, *Waste water disposal, Optimum development plans, Standards, Water allocation, Water distribution, Water resources, Sewage, Development, South Carolina.
Identifiers: Santee-Wateree Planning District(SC), Clarendon Co.(SC), Kershaw Co.(SC), Lee Co.(SC), Sumter Co.(SC).

This functional plan supplements the Water and Sewer Plan and Program prepared in May 1972 and is designed to provide a flexible guide for the development of water supply and waste water treatment facilities to meet the needs of Clarendon, Kershaw, Lee, and Sumter Counties. Purposes of report are to update inventory data; to scrutinize systems proposed to meet future needs; to prepare cost estimates for proposed systems and indicate priorities; and to present recommended procedures to serve as a guide for orderly development. Prime consideration was given to cost minimization and optimization of water resource uses. Based on established system design and water supply planning standards, an inventory of water supply and sewerage facilities is detailed including maps, short and long range plans, water usage data, population predictions, and future programs. A section on the relation of water and sewer systems capacity to area development summarizes the ability of the counties to absorb increased growth without adverse effects. (Salzman-North Carolina)

Identifiers: *Altahama Georgia Southern Area, Intergovernmental Coordination of Water and Sewer Services, Improved fiscal policies for water and sewer management, Audits, Fiscal policies.

Prepared to provide governing bodies in southern Georgia responsible for the development and operation of public water and sewer systems with a guide for improving operation and management, this study applies to Appling, Bulloch, Candler, Evans, Jeff Davis, Tattnall, Toombs, and Wayne counties. Present administrative, management, and operation methods are analyzed. Alternative methods for the provisions of more efficient administration and management are evaluated for economic feasibility. Recommendations for short range (5 year) and long range (20 year) improvements include: intergovernmental coordination of services with engineering feasibility studies of consolidation of Lyons-Santa Claus water and sewer systems, supplying water service to Higgston from Vidalia system, and establishment of a water supply authority to consolidate administration, management and operations; improved fiscal policies with annual budget and audit plus biennial rate review; upgrading skills in water and sewer administration through programs offered by Georgia's Institute of Government; and certification of all operators of water and sewer services. (Salzman-North Carolina)
W75-04196

PLANNING FOR WATER QUALITY IN THE VIRGIN RIVER SYSTEM IN THE STATE OF UTAH: A PROGRAM FOR DEVELOPING A COMPREHENSIVE WATER QUALITY MANAGEMENT PLAN.
Utah Water Research Lab., Logan.
Prepared for State of Utah Bureau of Environmental Health. PRWG-142-2, March, 1974. 88 p, 11 fig, 8 tab, 27 ref.

Descriptors: *Water quality, *Planning, *Management, *Water pollution control, *Baseline studies, *River basins, *Analytical techniques, Federal Water Pollution Control Act, Data collections, Data processing, Hydrologic data, Political aspects, Utah, Dissolved oxygen, Heated water.
Identifiers: *Virgin River(Utah), *Demographic activities, Effluent limitations.

Baseline information is developed which will allow water quality management planning for the Virgin River system. An initial source of background information and data is provided to facilitate the participation of local public officials, community leaders and citizens in water quality planning for the basin. The Physical, chemical, economic, political, and demographic activities which have an impact upon water quality within the basin are presented. Water quality standards applied to the Virgin River system, as described by the Utah State Division of Health and accepted by the Environmental Protection Agency are defined as class 'C' Water Quality Requirements. Specific reaches have been further classified for thermal discharge to prevent undue heating of the water and to limit the minimum level of dissolved oxygen in the stream. The program design, initial analysis of available data, and priority listing of water pollution problems presented provide a functional basis for developing comprehensive water quality management plans for the basin pursuant to the objectives of the Federal Water Pollution Control Act, including 1972 amendments. These plans will be an important part of implementing point source control and achieving the desired water quality programs. (See also W75-04207) (Diefendorf-North Carolina)
W75-04206

PLANNING FOR WATER QUALITY IN THE SEVIER RIVER SYSTEM IN THE STATE OF UTAH: A PROGRAM FOR DEVELOPING A COMPREHENSIVE WATER QUALITY MANAGEMENT PLAN.
Utah Water Research Lab., Logan.
Prepared for State of Utah Bureau of Environmental Health. PRWG-142-3, March, 1974. 96 p, 11 fig, 8 tab, 52 ref.

Descriptors: *Water quality standards, *Water quality, *Planning, *Management, *Water pollution control, *River basins, *Data collections, Federal Water Pollution Control Act, Baseline studies, Data processing, Analytical techniques, Hydrologic data, Political aspects, Utah, Dissolved oxygen.
Identifiers: *Sevier Lake(Utah), *Sevier River(Utah), Effluent limitations, Demographic activities, Environmental Protection Agency, Thermal discharge.

A functional planning program is presented to aid in the development of comprehensive water quality management plans for the Sevier River system. According to the Utah Division of Water Resources the Sevier River is the most completely utilized river in the U.S. The approximately 94% utilization of its water results in very little flowing into Sevier Lake which is normally dry. In Utah, water quality standards are primarily effluent standards oriented toward the effect of designated effluents on streams. Application of standards to waste effluents and to streams and lakes will lead to their improvement only if monitoring of the waters occurs and if standards are enforced. The Utah State Division of Health has described standards which have been applied to the Sevier River system and which are at least as strict as those proposed by the Environmental Protection Agency. These standards are defined as the class 'C' Water Quality Requirements. In addition, specific reaches of the Sevier system have been further classified for thermal discharge and minimal level of dissolved oxygen. The program design, initial analysis of available data, and priority listing of water pollution problems necessary for a basin plan presented here are consistent with the objectives of the Federal Water Pollution Control Act, including the 1972 amendments. NATURAL PHOSPHATE REMOVAL MECHANISMS IN SOUTH FLORIDA LAKES,
Miami Univ., Coral Gables, Fla. Dept. of Civil Engineering.
T. D. Waite, and W. J. Fogarty.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 472-481. 11 fig, 10 ref.

Descriptors: *Phosphates, *Nutrient removal, *Phosphorus compounds, *Fertilizers, *Eutrophication, *Florida, Lakes, Environmental effects, Water pollution sources, Productivity, Nitrates, Nitrogen compounds, Water quality, Plankton, Algae, Primary productivity, Chemicals, Fertilization, Phytoplankton, Agriculture, Drainage, Analytical techniques, Chemical analysis.

Two small lakes in the South Florida area were artificially fertilized with phosphate, and the rate of phosphate removal from the water column was determined. The removal rate was correlated with plant productivity and loss to the sediments. Chemical oxygen demand measurements were run on the lake water to obtain a qualitative indication of phytoplankton biomass. While all organic matter present in the lake water exerted a demand, the values were compared with productivity data for algae biomass fluctuations. After 120 days the lake was fertilized again, and the removal rate constant increased to 0.136 mg PO4/1/day. At this same time a second lake was artificially enriched and its removal rate constant was 0.137 mg/1 PO4/day. The more rapid loss of PO4 from the water during the second set of tests was attributed to an increase in groundwater flow. During all the analyses the NO3-N concentration = 0.03 - 0.3 mg/1, alkalinity = 100-150 mg/1 CaCO3, and NH3-N=.05-.01 mg/1. Plant productivity analyses on the benthic macrophytes and phytoplankton were performed during the second fertilization experiments. Results indicated that in one lake macrophyte growth represented 25-50% of the phosphate removal while 0.5-9% was removed by the phytoplankton. In the second test lake macrophyte growth accounted for 9-23% of the phosphate uptake, while 2-5% was utilized by the phytoplankton. These data indicate that greater than 50% of the phosphate added to the experimental lakes was removed by chemical precipitation. This was verified by phosphate concentrations in sediment core samples which reflected an increase after fertilization. (See also W75-04213) (Henley-ISWS)

REGIONAL LANDFILL AND CONSTRUCTION MATERIAL NEEDS IN TERMS OF DREDGED MATERIAL CHARACTERISTICS AND AVAILABILITY; VOLUME I: MAIN TEXT,
Green Associates, Inc., Towson, Md.
R. Reikenis, V. Elias, and E. F. Drabkowski.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-780 750, $8.75 in paper copy, $2.25 in microfiche. U.S. Army Engineer Waterways Experiment Station Contract Report D-74-2, May 1974. 269 p, 9 fig, 33 tab, 138 ref. DACW 39-73-C-0141.

Descriptors: *Dredging, *Landfills, *Construction materials, Dikes, *Disposal, Sites, Surveys, Planning, Regional analysis, Data collections.
Identifiers: Hydraulic fill, Diked disposal area.

A survey of the regional needs for landfill and construction material indicated that such needs vary substantially due to population shifts and economic growth of specific regions. Generally, regional needs were determined to be in excess of available volumes of dredged material, particularly in low-lying coastal areas. The survey also revealed that there were problems to overcome before dredged material was accepted for such usage. Regional investigations indicated that, given the projected quantities of dredged material, there could be large-scale disposal of dredged material on land sites. Desirable solutions to the dredged material disposal problem could be achieved by a detailed inventory of all identified future development projects, adoption of methodologies for selection of disposal sites, development of techniques to decrease time of sediment consolidation, and identification of the most economical application of present techniques or development of new techniques. COURTS BACK STATE'S POWER TO HALT ACID MINE DRAINAGE,
Pollution Control Guide, Vol 3, paragraph 19704, p 19181-19182, 1974.

Descriptors: *Judicial decisions, *Pennsylvania, *Legal aspects, *Acid mine water, Waste water treatment, Administrative agencies, Drainage systems, Waste water pollution, Permits, Pumping, Waste water disposal, Safety, Regulation, Water quality control, Water law, Water pollution control.
Identifiers: *State policy, Nuisance(Legal aspects), Injunctive relief.

Pennsylvanials Department of Environmental Resources has won two legal battles to curb acid mine drainage, the major cause of water pollution in the state. As a result mine operators can be required to treat all water discharged from their operations, even if the mine operator was not responsible for the pollution of the discharged water. The Department's rule that 'if you pump it out you have to treat it' had been challenged. Since pumping the drainage from the abandoned mine was essential to the safe operation of the active mine, the court concluded that it is a vital part of the complete drainage plan and therefore subject to regulation. Mine drainage does not cease to be mine drainage once mining has ceased in the mine from which it continues to drain. Mine drainage is simply waters polluted from the operation of a mine. The department could not get injunctive relief under the statutory provisions, but could get such relief under either theory of statutory or common law public nuisance. (Sperling-Florida)

SENATE SUBCOMMITTEE HEARS COMPLAINTS ON EPA WATER PROGRAMS.
Pollution Control Gudie, Vol 3, paragraph 19860, p 19603-19607, 1974. 5 p.

Descriptors: *Oregon, *Federal Water Pollution Control Act, *Environmental sanitation, *Environmental effects, *Administration, Administrative agencies, Coordination, Planning, Water quality control, Economic aspects, Legal aspects, Regulation, Standards, Industrial wastes, State governments, Permits, Water quality standards, Adoption of practices, Water law, Water policy.
Identifiers: *FWPCA Amendments of 1972, *Administrative regulations, Environmental policy.

The Direcetor of the Oregon Department of Environmental Quality states that in order to improve the environment people must have the desire for a high quality environment, and they must be willing to spend the money needed to improve the environment. Secondly the state's municipalities, industries, and other regulated and regulating agencies must not only support, but respect environmental programs. All aspects of the environment and their interrelation must be considered. The Federal Water Pollution Control Act and the 1972 Amendments will be the most influential basis for establishing present and future environmental programs. The Act does not, however, permit a state agency to approach environmental problems on an integrated basis. Instead the Act establishes arbitrary effluent standards that must be met by arbitrary deadlines, regardless of impacts on air quality, solid waste disposal, noise, or aesthetics. Another problem arises when permits, which are required to be issued immediately, must contain schedules to meet guidelines that have not yet been adopted. (Sperling-Florida)

NON-TRANSPORTATION OIL SPILL REGULATIONS.
Pollution Control Guide, Vol 3, paragraph 19936, p 19795-19797, 1973. 3 p.

Descriptors: *Regulation, *Federal Water Pollution Control Act, *Oily wastes, *Navigable waters, Transportation, Waste water disposal, Oil industry, United States, Water quality control, Adoption of practices, Planning, Administration, Administrative agencies, Industrial waste, Water pollution, Water law, Water quality, Water quality control, Oil pollution.

Identifiers: Notice, *Administrative regulations, State policy, *Environmental policy.

Notice of proposed rule-making was published pursuant to the Federal Water Pollution Control Act to prevent discharges of oil into the navigable waters of the United States and to contain such discharges if they occur. The regulations will prevent such spills by establishing procedures, methods, and equipment requirements of owners or operators of facilities engages in drilling, producing, storing, refining, distributing, or consuming oil. New facilities could achieve a higher level of spill prevention than older facilities by the use of fail-safe design concepts and innovative spill prevention methods and procedures. Older facilities could develop strong spill contingency plans and commit manpower, oil containment devices and removal equipment to compensate for existing weaknesses in the spill prevention equipment. No single standard or design could be prescribed for all non-transportation related facilities due to the varying factors of age, function and location. (Sperling-Florida)

WATER REUSE...SAFE DRINKING ACT...HOW SOON...HOW GOOD.
C. Heckroth.
Water and Wastes Engineering, Vol 11, No 8, p 32, 34, 36-37, August, 1974.

Descriptors: *Water pollution, *Water reuse, *Water laws, *Federal government, *State governments, Chlorination, Chemical treatment, Water purification, Toxicity, Heavy metals, *Potable water.
Identifiers: *Safe Drinking Water Act.

The 1974 American Water Works Association annual meeting considered the rising problems in the area of water use, reuse, master planning, dual systems, and the Safe Drinking Water Act. Representative Peter Kyros of Maine explained that the delay of the Act was due in part to the need for funds. Studies and adequate monitoring are needed, and these 'deficiencies give rise to technical uncertainty, which in turn impacts on our concern about having the EPA make judgments which will cause state and local governments to pour out large sums of money to clean up water supplies.' Congressmen are unsure as to whether enforcement, monitoring and reporting should rest with the states with no power of coercion or the federal government if the states should fail to take proper measures. They are also unsure as to whether standards should be set for tap water without providing operation and maintenance requirements. There is some question as to the availability of state funds to meet federal regulations. The administration's bill makes no provision to control underground injection of contaminants. Water supply administrators were seriously criticized. It was claimed that the most difficult metals to remove are arsenic, lead, cadmium and barium. Metal removal appears to function according to the efficiency of the activated sludge system nitrification. An increase in some metals has been attributed to chemical treatment. (Leibowitz-FIRL)
W75-04322

CONTROL OF WATER POLLUTION: MISCELLANEOUS PROVISIONS.
International Digest of Health Legislation, Vol 25, No 1, p 50-60, 1974.

Descriptors: *Water laws, *Public health, *Water pollution control, *Water quality, Management, Suspended solids, Toxicity, Wildlife, Birds, Aquatic life, Industrial wastes, Sewage, Discharge, Radioactivity, *Canada.
Identifiers: *Saskatchewan water resources, The Water Resources Management Act, The Department of the Environment Act(Canada).

The Water Resources Management Act of 1972 and the Department of the Environment Act of 1972 are expected to become laws in Canada simultaneously. The latter act repeals the Water Resources Commission Act as amended. Pollution is defined as any change in the temperature, taste, or odor of Saskatchewan waters; the addition or removal of any liquid, solid, radioactive, gaseous, or other substance that will be harmful to the public health or that is unsafe for domestic, municipal, industrial, agricultural, recreational, or other lawful usage or that is detrimental to wildlife, birds, or aquatic life, or sewage containing animal, vegetable or mineral matter in suspension or solution, including rainwater resulting from melted snow or ice which has entered the sewage works. The Minister of the Environment is made responsible for administering the water resources of Saskatchewan and supervising all pollution matters. The Minister is also responsible for the general supervision, control, and regulation of all matters concerning waterworks, sewage, water quality, and its impairment. The municipality's medical health officer is to advise the Minister on matters of public health relating to water and sewage. (Leibowitz-FIRL)

QUALITY CONTROL IN RIVER MANAGEMENT OF THE BRISTOL AVON,
Bristol Avon River Authority (England).
G. S. N. Ingham.
Water Pollution Control, Vol 73, No 4, p 425-432, 1974.

Descriptors: *Water quality control, Management, *Water pollution control, *Industrial wastes, Waste water treatment, Rivers, Flow characteristics, Effluent control, Water reuse, Self-purification, *Quality control, Regulation.
Identifiers: *Bristol Avon River Authority(UK), Pollution Prevention Acts, Rivers Act(1961).

The River Avon and its tributaries receive 200 x 1000 cu m of sewage effluent, 335 x 1000 cu m of industrial waste water, and an unknown volume of effluent from about 4000 farms roughly estimated at 15 x 1000 cu m daily. The river system carries an estimated effluent load of 550 x 1000 cu m/d DWF. Quality control is required on a closely detailed scale, since each section of the river receives direct effluent, influencing the next downstream section, and being itself influenced by its adjoining upstream stretch. Quality control necessitates flow and quality data at or near the source of every river and tributary; flow and quality data at strategic points down the river or tributary to its confluence; flow and quality data of all important effluents discharged into each river; and, the locations and quantities of abstractions. From such data the following becomes available: maximum, minimum, mean and median for flow and quality parameters, and the standard deviation of all parameter values; effluent effects and their location; recovery rate; pollution load carried; maximum pollution load safety carriable; extent to which overloading occurs; extent to which effluent regulations are applicable; identification of lengths where there are unknown discharges; abstraction effects; extent of abstraction restrictions needed; and, the extent to which abstraction is possible. (Leibowitz-FIRL)

POLLUTION AND PUBLIC HEALTH: TACONITE CASE POSES MAJOR TEST,
L. J. Carter.
Science, Vol 186, No 4158, p 31-34, 36, October 4, 1974. 1 fig.

Descriptors: *Lake Superior, *Water pollution, *Public health, Mining, *Mine wastes, *Asbestos, Benthos, Potable water, Human diseases, Water supply, Industrial wastes, Municipal water.
Identifiers: *Taconite tailings, Cancer, Green water phenomenon.

Lake Superior has for the past 18 years been polluted by the wastes of the Reserve Mining Company. The Lake, which was once considered of such purity that Duluth, Minnesota, among other cities, used its water for drinking, is the largest body of freshwater on earth - 350 miles long, 160 miles across at its widest, and up to 1333 feet deep. The lake, however, is not large enough to assimilate the Reserve's discharge of taconite tailings; the discharge is fivefold greater than the 12,000 tons of solids estimated to enter naturally each day from the inflow of about 200 rivers and the erosion of miles of shoreline. The tailings have despoiled some 200 square miles of the west end of the lake. The tailings delta extends 4000 feet offshore from the discharge point, and is nearly a mile wide. The tailings have settled at the bottom over large areas, smothering benthic organisms and harming the ecology of the lake. The green water phenomenon occurs over many miles of the lake when large quantities of light-reflective tailings surface. Last year it was determined that tailing fibers indistinguishable from amphiobole asbestos fibers were present in Duluth drinking water. A high incidence of cancer occurs among persons exposed to asbestos in their jobs and in the environment, giving a federal suit against the Reserve new impetus. (Leibowitz-FIRL)

HYDRODYNAMIC EFFECTS OF OIL SLICK MECHANICAL CONTROL DEVICES,
Texas A and M Research Foundation, College Station.
L. A. Hale.
Available from the National Technical Information Service Springfield, Va. 22161 as AD-777 926, $4.75 paper copy, and $2.25 microfiche. Report No CG-D-64-74, February 1974. 84 p, 60 fig, 5 tab. DOT-CG-23357-A.

Descriptors: *Oil spills, *Model studies, *Laboratory tests, *Oil, Pollution, Hydraulic models, Energy dissipation, Theoretical analysis, Hydrodynamics, Flow, Mechanical control, Equipment, Velocity, Flumes, *Water pollution control.
Identifiers: *Oil slicks, Two-phase flow.

A section of a research program conducted by the U.S. Coast Guard was summarized. The objective was to investigate the behavior of an oil slick under the influence of various mechanical control devices. Four types of slick control mechanisms were investigated: (a) oil slick energy dissipation, (b) oil slick shields, (c) rapid removal of oil by lifting mechanisms, (d) oil slick submersion devices. The tests were conducted in a 150-foot tilting flume. Three test oils were used: (a) No. 2 diesel oil, (b) SAE 30 lubricating oil, (c) SAE 140 lubricating oil. The results showed that devices or systems using energy dissipation elements could capture and hold a significant volume of oil at current velocities significantly greater than those causing the failure of conventional containment barriers. Slick shield devices, operated as a secondary element of an energy dissipation system, served a valuable function in protecting a quiet oil pool from the direct action of a high velocity current. Surface penetrating blades appear to have merit only for smooth surface operations. If further testing is to be performed it is felt that the entire blade system should be moved relative to still water to minimize surface irregularity problems. Under high current situations, the flow near the surface of submersion devices was dominated by inertial effects so that the viscous effects, significant to the boundary layer phenomena associated with the moving surfaces, were negligable. No features of the flow of the slick under the influence of submersion devices were considered to be advantageous for the control of slicks under high current situations. (Humphreys-ISWS)

ELKHORN RIVER BASIN SCREENING MODEL, A REPORT TO THE MISSOURI RIVER BASIN COMMISSION,
Nebraska Univ., Lincoln. Water Resources Research Inst.
W. Viessman, Jr., G. L. Lewis, I. Yomtovian, and J. Envoldsen.
May 1974. 335 p, 94 fig, 146 tab, 9 ref, 5 append.

Descriptors: Surface water, Watersheds(Basins), *Water policy, *Multiple-purpose projects, *Linear programming, *Reservoirs, *Flood control, *Investment, *River basin commissions, *Model studies, Alternative planning, Optimization, Simulation analysis, Constraints, Evaluation, Management, Annual, Costs, Flood damage, Irrigation, Recreation, Storage, Equations, *Nebraska, Water resources development.
Identifiers: *Elkhorn River Subbasin(Neb), Screening models, Water uses, Sensitivity analysis, Cost minimization, Benefit maximization.

Investment and management decision making for basin-wide surface water systems is considered and a linear programming investment screening model is described. The general model consists of a set of constraints defining possible investment and operating policy alternatives and an objective function for evaluating these. Surface water uses in the Elkhorn River Subbasin include irrigation, recreation, fish and wildlife enhancement, and flood control. The Elkhorn Basin preliminary screening model is described in detail. For each site in the basin, a set of equations which represents average annual costs and benefits to be gained from various activities is formulated. Objectives used in evaluating alternatives include both cost minimization and benefit maximization. A constraint set assures inclusion of pertinent physical, institutional, or legal restrictions. The model structure for flood control is elaborated, and a flood-event simulation and routing model to be used extensively in conjunction with the optimization model is described. The model develops benefit functions and functional relationships between flood peaks and various reservoir capacities. A description and an analysis of model runs on seven watersheds in the Elkhorn River Subbasin are presented. Appendices give: list of variables; agency data for reservoirs and data for flood damage sites; screening model schematics; and optimization run tabulations. (Bell-Cornell)

APPLICATION OF ANALOG TECHNIQUES TO WATER MANAGEMENT,
Nevada Univ., Reno. Desert Research Inst.
H. A. Shamberger, and P. A. Domenico.
Presented at A.S.C.E. Fourteenth Hydraulics Division Conference, August, 25, 1965, University of Arizona, Tucson, p 1-22, 12 fig.

Descriptors: *Ground water availability, *Water management, *Analog models, *Aquifer management, *Ground water, *Artesian aquifers, *Nevada, Model studies, Computer models, Resistance networks, Aquifers, Aquifer systems, Water sources, Water yield, Permeability, Porosity, Water supply, Water demand, Water resources, Water resources development, Water table, Subsurface waters, Water wells, Ground water resources, Watersheds(Basins), Urbanization.
Identifiers: *Electric analog models, *Las Vegas Valley(Nevada), Ground water development, Lake Mead(Nevada), Physical analog.

Effects of vague natural phenomenon can be measured through use of systems which are of similar but more predictable performance. In Las Vegas Valley, Nevada, rapidly declining water pressure levels are of concern. Ground water reservoir depletion has been tolerated because it was hoped that Lake Mead would provide a large portion of the water supply. An electrical analog of the Valley applies the time-variant or transient flow of ground water as simulated by the time varying flow of electrical current. The resistance of the model changes the potential of the flow as the aquifer permeability reduces the potential of moving fluid; voltage and current become analogous, to head and flow of water. By measuring these voltages and currents, the aquifer's response to pumping can be determined. Factors revealed in the study include: (1) acceleration of ground water production will not result in excess development of the Valley; (2) if surface water is imported, pumping facilities can be developed; and (3) local problems with shallow domestic wells may arise before importation facilities are completed. The analog is being used to aid ground water management in the state. (Grden-North Carolina)

MORE RESPONSIVE WATER PLANNING IS POSSIBLE,
Washington State Univ., Pullman. R. L. Albrook Hydraulic Lab.
H. D. Copp.
Prepared for Washington State Department of Ecology through the State of Washington Water Research Center. Engineering Extension Service, Pullman, Washington, Bulletin 330, March 1973. 81 p, 6 fig, 12 tab, 37 ref, 3 append.

Descriptors: *Water resources, *Washington, *Water policy, *Planning, Water resources development, Regional development, Water allocation(Policy), Legislation.
Identifiers: SOLAR(Store Abstracts and Provide On Line Automatic Retrieval), *Water Resources Act of 1971(Washington), *Public participation.

After three years of inquiry efforts and study of water planning and management activities in Washington, the success was assessed of present policy and procedures, along with the possibility of improvement through new methodologies. Assuming that failure of past water resource planning stemmed from the public not being given appropriate opportunity to participate in planning and decision-making, a planning process to be implemented by planners in response to public demand is outlined. In-accessibility to information creates a hindrance to water resource planning which can be eliminated by the establishment of a water resource archive patterned after a similar retrieval system such as SOLAR (Store Abstracts and Provide On Line Automatic Retrieval). Preplanning organizational effort allows for responsible decision-making. The planner formulates alternatives representing public preference and attempts to implement changes through control and guidance. Innovative and flexible planning procedures include: (1) objectives and techniques for public participation, (2) implementation of public involvement programs, (3) definition of planning areas, (4) organization of local sponsoring groups to conduct information programs, (5) initiation of public needs, (6) selection of a local contact group (7 to 10 persons) to act as liaison, (7) creation of public workshops to serve as a forum, (8) a planning commitment to public involvement programs and (9) an awareness of political influence and ability to cope with it. Realizing planning has been costly, inefficient and excessive in overlap, Washington State enacted a Water Resources Act of 1971 which would provide framework for this prescribed program. (Salzman-North Carolina)

Descriptors: *Water resources, *Planning, *Simulation analysis, *Comprehensive planning, Multiple purpose, Multiple purpose projects, Optimization, Cultures.
Identifiers: Planning style, Simulation games, Cognitive information, Affective information, Nuerland, Validation approach.

The role of the planner and of multiple objective planning in the expanding technology of modern society was discussed. The orientation and attitudes associated with considerations of who benefits from a plan, whose objectives are included, and who participates in planning decisions were defined as major elements of planning style. The simulation game was explored as a technique for making major aspects of planning style more explicit. Both cognitive and affective information can be derived from the application of simulation games to planning. Both of these areas of information were discussed. (See also W75-04213) (Terstriep-ISWS)

THE APPROXIMATE PROBABILITY DENSITY FUNCTION OF RANGE AND ADJUSTED RANGE,
National Energy Authority, Bangkok (Thailand).
P. Sutabutr.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 427-438. 3 fig, 2 tab, 10 ref.

Descriptors: *Markov processes, *Probability, *Statistics, Mathematics, Mathematical studies, Statistical Methods, Synthetic hydrology, Systems analysis.
Identifiers: *Approximate probability density function, Random processes.

The objectives were to develop the general expression approximately for probability density function and probability distribution function for the random variable range of both the independent random normal variable and dependent random normal variable of the first and second order Markov linear model. By using the four basic parameters (mean, variance, skew, and excess coefficients) obtained by generation and by applying the basic criteria set by Pearson, the approximate probability density function of range was obtained as one of the best fitted from his family of curves. The parameters of this probability density function can then be computed by using the exact and approximate expression for the expected value and variance of the maximum range of the independent normal variable or dependent normal variable of the first and second order Markov linear model derived previously by others. TOWARD A SCIENCE POLICY FOR COMPUTERS IN WATER RESOURCES: TRENDS AND ISSUES,
Illinois Univerity, Chicago. Dept. of Engineering.
G. Bugliarello, and F. J. Gunther.
In: Water for the Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 277-283. 6 ref. OWRT X-113(No 3422)(1).

Descriptors: *Computers, *Water resources, *Systems analysis, Computer programs, Programming languages, Research equipment, Methodology, Technology, Management, Planning.

An overview is provided of the most critical issues that have emerged and are likely to emerge in the future as a result of the development of computer technology. Consideration of these issues should be fundamental to policy generation by both governmental agencies and users organizations. The following pivotal issues were discussed and recommendations for appropriate action made: (1) the establishment of computer utilities; (2) the introduction and diffusion of minicomputers; (3) the development of intimately connected computer-instrument packages; (4) the factors influencing the application of hybrid systems; (5) the upgrading of software engineering and management; (6) facilitation of the user's approach to the computer and modes of communication; (7) continued development of appropriate schemes for the analysis, planning, design, and operation of water resources systems; and (8) consideration of the establishment of master computer programs with compatible flexibility as a viable alternative to 'ad hoc' approaches to problem solution. Descriptors: *California, *Water districts, *Decision making, Management, *Cost-benefit analysis, *Water policy, Local governments.
Identifiers: *Voting.

A study was made of those special districts in California which promote, protect, and guide the administration of water resources. The history of water districts is explored with special attention paid to the districts' authorities and powers derived from statutes as well as court decisions. The performance of Local Agency Formation Commissions, as agencies that authorize and control water districts, is assessed. Leadership of district governing bodies is studies; socio-economic data about these leaders are presented as well as information concerning their tenure and motivations for serving. The decision-making process in water districts is examined and particular attention is given to the electroal process. The study also examines certain economic effects of water board decisions relating to water pricing, land assessment, and water delivery. As more districts were formed to meet urban water needs, they were formed under enabling acts that required property qualifications for voting and permitted weighted voting. This system of voting enables individuals with large land-holdings to control some districts. There is also evidence that this system of voting not only results in infrequent elections but also low voter turnout when elections are held. Also enormous subsidies accrue to large landowners under the special provisions of Reclamation Law.

Identifiers: Manufacturing, Process design, Price elasticity, Trends, Urban water supply.

Empirical evidence regarding shifts in industrial water use is presented to provide greater understanding of the impact of changes in the cost and quality of water on technological changes in process design and plant location decisions. The ways in which water enters industrial processes are identified. An historical perspective on the scope and dynamics of water use in manufacturing is provided. Both industry and regional (including temporal) variations in water use and reuse in selected industries are examined to determine the extent to which water use technology has been changing. Next, the location decisions of water-using firms are examined. Considered are shifting employment patterns and the effects of water pollution controls. The a cross-section model of industry response to water costs is presented. Demand equations for gross water and intake water are specified and then estimated using cross-section plant data for the paper, chemical, petroleum, and steel industries. Results show a statistically significant relationship between water cost and water demand, with demand elasticities on the order of .5 to 1.0. Rising water costs are decreasing the importance of water for processing as a criterion for discriminating between location sites. (Bell-Cornell)

Identifiers: *United Kingdom.

The future plans for water resources in Britain are discussed. River management, water supply, and sewage disposal are under the control of new regional water authorities. A Central Water Planning Unit assists with the issues on a national basis, at the government level and at the regional level. The possibility that a new weather pattern is developing is also discussed. Proposals for climatic research are under consideration. The CWPU would like to develop a 'national water grid' involving transfers from region to region and the extension of the present system of river regulation. There are plans to develop groundwater abstraction. Desalination is also being considered but does not appear to be feasible. (Orr-FIRL)

Descriptors: Water resources development, Planning, Environment, Ecology, Recreational facilities, Attitudes, *Management, *Urban sociology, *City planning, *Urbanization, *Benefits, Water utilization, Legal aspects, Human population, *Community development.
Identifiers: *Urban environmental enhancement, Water-oriented amenities, Governmental structure, Community attitudes.

Natural and man-made water bodies and facilities are resources that can be managed to enhance urban environments. While such water-oriented amenities may be more desirable in sparsely populated areas, recreation and esthetic enjoyment can be provided in most places. Such urban water management may provide social benefits including diminution of tensions and better balanced communities. Specific metropolitan areas were studied including Harrisburg, Pennsylvania; Waterloo, Iowa; Houston, San Antonio, and Flower Mound, Texas; Sacramento, California; Minneapolis-St. Paul, Minnesota; and Columbia, Maryland. These studies show how different areas have approached or neglected the use of water for urban enhancement. Governmental structure, community attitudes, and the water resources available are important factors. Federal, state, and local governments all have responsibilities in water management for environmental improvement. Recommendations are presented in general terms and in relation to the several case studies.

THE NEXT TEN YEARS: SOME RECOMMENDATIONS TO THE DELAWARE RIVER BASIN COMMISSION,
Pennsylvania Univ. Philadelphia. Inst. for Environmental Studies.
A. L. Strong, J. C. Keene, and J. Hillsberg.
April, 1971. 23 p.

Descriptors: *Water management, *Delaware River Basin Commission, *Interstate commissions, *River basin commission, *Water pollution, Abatement, Delaware, Delaware River, Maryland, New York, New Jersey, River basins, Water resources, Water pollution treatment, Water pollution sources, Water pollution effects, Water policy, Water demand, Water supply, Watershed management, Water quality standards, Water resources development, Comprehensive planning.
Identifiers: Citizen's Advisory Committee.

In its first ten years, the Delaware River Basin Commission (DRBC) implemented a pollution abatement and regulation program. Now DRBC must consider long-range needs; recommendations for improving programs and procedures are specified. DRBC should place high priority on protecting flood plains and other wetlands; and proposals to preserve and enhance water-related natural, historic, and scenic areas; and incorporate policies allocating water for use, consumption, and waste assimilation. It is also recommended that DRBC seek more grants and appropriations from the federal government and the 4 states, use its power to charge for its services although a study or risks and benefits involved by various possible charges is suggested prior to initiation, and change tax laws to better serve objectives. To enforce water quality standards, waste discharges should be monitored by DRBC and should bear the monitoring costs. The Commission should also create an ombudsman position, provide more public interest protection in advance of hearings, and strengthen the role of technically-qualified persons at hearings. Changes recommended in organizational structure include appointment of full-time commissioners, development of a Citizen's Advisory Committee, and establishment of a deputy director. THE ELEMENTS OF CARRYING CAPACITY IN THE RECREATION UTILIZATION OF RESERVOIRS,
Bureau of Reclamation, Denver, Colo. Lower Missouri Region.

R. A. Crysdale.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 459-471. 35 ref.

Descriptors: *Recreation, *Recreation demand, *Reservoirs, Social needs, Economics, Use rates, Psychological aspects, Water skiing, Fishing, Boating, Recreation facilities, Administration.

The literature generated by universities, governmental agencies, professional organizations, and water sport experts provides a cross section of specialized disciplinary viewpoints on the concept of recreation carrying capacity of water bodies. Administrative, biological, physical, social, and temporal elements interacting with each other influence the degree reservoirs are utilized for various water recreation activities. An understanding of each element and its relationships to the other elements provides recreation planners, developers, and managers insight to the inherent and dynamic complexity of carrying capacity of reservoirs. However, the recreation carrying capacity of water resources is an artificial concept. It is also the only concept available and, therefore, must be used with caution for water resources planning, development, and management. (See also W75-04213) (Gibb-ISWS)

Descriptors: *Water resources development, *Hydrogeology, *Model studies, *Illinois, Groundwater resources, Groundwater, Water demand, Planning, Management, City planning, Recharge.
Identifiers: Kane County(Ill).

Kane County is located in northeastern Illinois, 60 miles west of Chicago. Currently, the county is on the edge of Chicago's outward urban expansion, with three major developments in the planning stages, including two new towns. Kane County primarily relies on groundwater resources. The projected increase in population, industry, and commerce will increase the demand for water. This will require better water resources management. A projected model for future water use was discussed. (See also W75-04213) (Scott-ISWS)

HOW CHICAGO MANAGES ITS DISTRIBUTION SYSTEM,
Chicago Dept. of Water and Sewers, Ill.
J. D. Starr.
Journal of the American Water Works Association, Vol 66, No 6, p 328-331, June, 1974.

Descriptors: *Water management, *Water policy, *Water distribution, *Water delivery, *Water works, Illinois, Water demand, Water supply, Water requirements, Water utilization, Water supply development, Water costs, Water users, Water control, Municipal water, Beneficial use, Water quality.
Identifiers: *Chicago(Illinois), *Department of Water and Sewers, *Bureau of Water, *Water Distribution Division, Bureau of Sewers, Water use, Water system.

The operations and capital improvements programs of the Chicago Department of Water and Sewers are supported by the water fund which must be completely self-supporting--receiving no tax monies of any kind. Revenue is derived from water charges and funds borrowed through the sale of water bonds. The Department is divided into the Bureau of Water and the Bureau of Sewers. One of the five divisions of the Water Bureau, the Water Distribution Division, having the most employees and the largest budget is discussed. It has five sections: (1) administrative which coordinates preparation of annual budget, develops specifications for pipe and appurtenances and maintains a 365 day-a-year complaint-and-information center; (2) engineering which continually plans for current requirements and future needs. Sound-level metering devices are used to detect leaks keeping water loss to a minimum; (3) plumbing inspection where all new and remodeling work performed by contractors is checked ro compliance with plumbing code. Continual house-to-house inspection of non-metered properties to detect leaks is carried on; (4) district field sections which perform construction and maintenance with strong emphasis on safe work practices; (5) machinery; (6) garage; (7) inventory and controls; and (8) tapping. A Students-as-Trainees and a job rotation program for newly employed engineers have been effective in increasing efficient operation. Even though the Department of Water and Sewers is operating under strict financial controls, the water system effectively furnishes water to the community at a cost ranking among the lowest of any metropolitan area in the country, costing about 6 1/2 cents per ton in Chicago. (Grden-North Carolina)
W75-04197

ATTITUDES TOWARD PAYMENT FOR RESOURCE USE: THE CASE OF DOMESTIC WATER CONSUMPTION,
Haifa Univ. (Israel).
C. S. Kamen, and P. Darr (Dalinsky).
Journal of Environmental Systems, Vol 4, No 1, Spring, 1974. p 1-21, 1 fig, 9 tab, 20 ref.

Descriptors: *Behavior, *Psychological aspects, *Domestic water, *Domestic use, *Water consumption, Water utilization, Potable water, Water quality.
Identifiers: Israel.

The interrelationships among socio-economic variables, attitudes and domestic water consumption are examined for a sample of 1,892 Israeli urban households. In Israel, the increased demand for domestic water is accompanied by quality deterioration due to pollution of water sources and possible expense of large-scale desalination of sea water. The analysis focuses on willingness to pay more for household water under various conditions, in an attempt to identify factors affecting individual readiness to pay for use of natural resources. The findings dealt with reported water use, limitation of use due to price, willingness to pay more for water, attitudes toward water quality, perception of water as commodity, effects of different systems of charges and relationship between social-psychological variable and measured consumption. Analysis reveals that willingness to pay depends both on the price demanded and on the purpose of the payment, that the equitability of the system of charges has an effect on willingness to pay, and that particular charge systems are not necessarily effective in attaining their intended ends. Although no relationship is found between attitudes toward water use and actual consumption, the analysis shows that social-psychological variables are important in determining individual readiness to undertake additional expenses which must be incurred as part of efforts to maintain environmental quality. W75-04201

COST OF IMPORTING DEEP SANDSTONE WATER TO ELIMINATE GROUNDWATER DEFICITS IN NORTHEASTERN ILLINOIS,
Illinois State Water Survey, Urbana.
D. W. Beaver.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 300, $3.25 in paper copy, $2.25 in microfiche. Circular 120, 1974. 17 p, 4 fig, 8 tab, 5 ref.

Descriptors: *Costs, *Groundwater, *Economics, *Water resources development, Decision making, Water costs, Pipelines, Unit costs, Aquifers, Water supply, Water supply development, Groundwater resources, Water treatment, *Illinois, *Water importing, *Water transfer.
Identifiers: Kane County(Ill), McHenry County(Ill), Lake County(Ill), Du Page County(Ill), Cook County(Ill), Will County(Ill), Townships.

The cost of importing groundwater to eliminate projected deficits was estimated for deficient townships within the 6-county area of northeastern Illinois. The sole source of imported water was assumed to be deep sandstone water from neighboring townships. The total cost of water at a given deficient township consisted of the raw water cost and the treatment cost. The raw water cost consisted of the cost of locally produced raw water and the cost of imported raw water needed to satisfy the deficit. The cost of imported raw water consisted of the production cost at the source township and the transmission cost to bring the water to the deficient township. Transmission costs were calculated from published data and formulas assuming that the water was transmitted along portions of an idealized network based on the existing system of highways, streets, and railways. The total deficit at a given township was assumed to be met with water imported from a single source township. The least expensive source of water for importation was determined separately for each deficient township. The total cost of production and transmission was charged to the deficient township. Treatment of imported raw water was assumed to take place at the deficient township. The treatment cost was found to be the most significant cost component, accounting for nearly 60% of the total cost. The transmission cost was a relatively small cost component, accounting for 10 to 18% of the raw water cost and only 4 to 8% of the total cost. It was concluded that the groundwater resources available in northeastern Illinois should be adequate to meet the demands of the area until 2020, if mining of water from the deep sandstone aquifers is continued. 6D. Water Demand

USE OF WATER IN GEORGIA, 1970, WITH PROJECTIONS TO 1990,
Geological Survey, Atlanta, Ga.
R. F. Carter, and A. M. F. Johnson.
Georgia Water Resources Survey, Earth and Water Division Hydrologic Report 2, 1974. 74p, 9 fig, 7 tab, 20 ref.

Descriptors: *Water resources, *Water utilization, *Water uses, *Water demand, *Georgia, Data collections, Hydrologic data, Groundwater, Surface waters, Water supply, Water yield, Forecasting, Projections, Municipal water, Industrial water, Domestic water, Livestock, Cooling water.

Estimates of water use in Georgia in 1970 indicate that an average of about 5,560 mgd (21.0 cu hm/d) was withdrawn for four principal off-channel uses, which are (1) public supply (for domestic, commercial, and industrial uses), (2) rural (domestic, livestock, and irrigation), (3) self-supplied industrial, and (4) thermoelectric power. The fifth principal withdrawal use, hydroelectric power (an in-channel use), amounted to about 52,000 mgd (197 cu hm/d). In computing total withdrawals, recirculation (reuse) by a user is not counted, but withdrawal of the same water (cumulative withdrawal) by a downstream user is counted. Estimates of water withdrawal from the principal sources for off-channel use include 690 mgd (2.61 cu hm/d) from groundwater and 4,870 mgd (18.4 cu hm/d) from surface water. Consumptive use of water is projected to increase by slightly more than 100% by 1990, the increase being from 318 mgd (1.20 cu hm/d) to 760 mgd (2.88 cu hm/d). A large part of the increase will be due to evaporation from cooling towers of thermoelectric plants. (Woodard-USGS)

UNITED STATES V. 21.54 ACRES OF LAND, MARSHALL COUNTY, WEST VIRGINIA (CONDEMNATION CASE FOR FLOWAGE EASEMENTS NEAR DAM SITE).
491 F 2d 301 (4th Cir W Va 1973).

Descriptors: United States, *Condemnation, *Easements, *Eminent domain, *High water mark, Legal aspects, Jurisdiction, Compensation, Navigable waters, Boundaries(Property), Dams, Contours, Elevation, Ohio River, Water level, Property values, Floods, Federal jurisdiction, Judicial decisions, Adjudication procedure, Dam construction, Flooding, Depreciation, *West Virginia.
Identifiers: *Inverse condemnation, Dam effects.

Appellee United States acquired flowage easements through condemnation for a dam project. An issue arose over the accuracy of the declaration for the extent of taking. Appellant landowners contended that appellee erred in determining the location of the ordinary high water mark on fish creek. This would have meant that the extent of the taking was in error and that the landowners would have to be compensated for the land located between the ordinary high water mark and the highest elevation of the land to be acquired. The trial judge refused to determine the location of the high water mark on the grounds that he did not have jurisdiction to do so. The appellate court decided that the trial judge had erred and did have jurisdiction to find as fact the actual location of the ordinary high water mark. This failure of the trial judge resulted in possible prejudice to the landowners the court stated. Thereupon the decision of the trial court was vacated and the case remanded with instructions to the United States District Court. (Chennault-Florida)

WINEMAN V. SHANNON BROTHERS LUMBER CO., INC. (ACTION BETWEEN COTERMINOUS RIPARIAN LANDOWNERS TO DETERMINE ACCRETION APPORTIONMENT).
368 F Supp 652 (N D Miss 1973).

Descriptors: *Mississippi, *Judicial decisions, *Accretion(Legal aspects), *Equitable apportionment, *Boundary disputes, Legal aspects, Water law, Boundaries(Property), Federal jurisdiction, Land tenure, Real property, Shores, Thalweg, Adjacent landowners, Adverse possession, Common law, Equity, Riparian land, Mississippi River, Adjudication procedure.
Identifiers: Liability(Legal aspects).

This suit is between coterminous riparian landowners to determine the apportionment of accretions. The plaintiffs also sought damages for the wrongful cutting of timber by the defendant corporation on the disputed portion of the accretions. The plaintiffs contended that the accretions should have been apportioned according to the thalweg or right angle rule. The defendant argued that the accretions should have been divided by extending the boundary between the two properties which had been established in a similar apportionment suit in 1919. In addition, the defendant contended that this extended boundary had been recognized as the dividing line between the properties by the parties and their predecessors in title under such circumstances as to have given the defendant superior title to the disputed accretions by reason of adverse possession. Finding that the evidence failed to establish adverse possession, the Federal District Court held that the thalweg or right angle rule applied in the instant case established the same diversion as the application of the general rule of apportionment and resulted in the more equitable diversion of the accretion. The court awarded the plaintiffs compensatory damages for the cut timber, but finding that the defendant acted in good faith, declined to impose any statutory penalty. (Deckert-Florida)

THE EMERGING RIGHT OF PHYSICAL ENFORCEMENT OF FISHERIES MEASURES BEYOND TERRITORIAL LIMITS,
Wisconsin Univ., Madison. School of Law.
R. B. Bilder.
University of Wisconsin Sea Grant College Program, Technical Report No 222, July 1974. 28 p, 24 ref.

Descriptors: *Law of the sea, *International law, *Fisheries, *Regulation, *Jurisdiction, Commercial fishing, Conservation, Fish management, Fish harvest, Boundary disputes(Legal aspects), Legal aspects, Adoption of practices, Governments, Oceans, Natural resources, Fisheries, Law enforcement, Marine fisheries.
Identifiers: Coastal waters, Contiguous zone, Territorial seas(Jurisdiction), International agreements, Territorial waters.

It is fairly likely that the Caracas Law of the Sea Conference will couple agreement on a fairly narrow territorial sea, probably twelve miles, with recognition of the rights of coastal states to regulate fishing in adjacent areas. The emergence of a regime of extensive coastal state fisheries jurisdiction has been presaged by the general trend toward establishment of broader fishery limits during the past several decades. A number of coastal states have made it clear that they will press vigorously for very broad coastal state regulatory authority over adjacent fisheries, ranging in some proposals out to two hundred miles. Some proposals appear virtually equivalent to an extended territorial sea. Others would establish an exclusive fishery zone. Others would grant the coastal states limited regulatory or managerial powers for special conservation and other purposes. Whatever form is followed, it is likely that traditional concepts of freedom to fish on the high seas will be significantly changed. (Sperling-Florida)

UNITED STATES V. KENNEBEC LOG DRIVING CO. ET AL. (SUIT BY GOVERNMENT TO ENJOIN LOG-DRIVING ACTIVITIES ON UPPER KENNEBEC RIVER).
491 F 2d 562 (1st Cir Maine 1973).

Descriptors: United States, *Navigable waters, *Rivers and Harbors Act, *Water pollution, *Maine. Lumbering, Wastes, Federal Water Pollution Control Act, Navigation, Channels, Legislation, Permits, Downstream, Rivers, Regulation, Watercourses, Environment, Environmental effects, Water pollution control, Waste disposal, Water resources, Water pollution sources, Water pollution effects, Water management(Applied).
Identifiers: *Refuse Act of 1899, *Navigation obstructions, Kennebec River(ME).

Appellant, United States, brought suit under the Rivers and Harbors Act of 1899 to enjoin the log driving by appellee, company, on the Kennebec River. Appellant claimed these activities violated sections 10 and 13 of the Act which respectively prohibited obstructing navigation and depositing refuse in navigable waters of the United States. On cross motions as to summary Judgment, the lower court found that the Act created an exception from the applicable sections for logging booms on rivers where log driving is the principal form of navigation. The log driving activities of the company were legal despite the lack of a permit. The motion of the government was denied and that of appellees granted. The government appealed. The court of appeals held that the sections of the Rivers and Harbors Act pertaining to obstruction of navigable waters did not apply to log driving on Kennebec River but that the section relating to deposit of refuse did apply. The judgement of the district court was vacated and the case remanded for further consideration. (Chennault-Florida)
W75-03996

KELSO V. C.B.K. AGRONOMICS, INC. (ACTION BY UPSTREAM LANDOWNERS FOR DAMAGES DUE TO CONSTRUCTION OF CONCRETE STRUCTURE ACROSS RIVER BY DOWNSTREAM OWNERS).
510 SW 2d 709 (Mo Ct App 1974).

Descriptors: *Missouri, *Judicial decisions, *Flood damage, *Watercourses, *Bridge construction, Bridges, Dams, Rivers, Legal aspects, Negligence, Floods, Riparian land, Natural flow, Construction, Water law, Adjudication procedure.
Identifiers: *Liability(Legal aspects), Proximate causation, Dam effects.

Owners of upstream real estate brought an action for damages to their farm and real estate caused by the construction of a concrete structure utilized by defendant as a bridge across the river. The defendant's bridge was located one mile downstream from the plaintiff. The structure rose about nine feet from the river bed, and it had four forty-eight inch tubes through it. The Missouri Court of Appeals held that because the structure acted like a dam the case was submissible to the jury on the theory of negligence and proximate cause of damage to the plaintiff's property by reason of longer periods of flooding. Where a permanent structure in a natural watercourse causes only transient damage or injury dependent upon the season and the terrain affected, the upstream owner might be entitled to prospective damages in addition to those accured, providing proof is present that the damage is certain to recur. In: Current Aspects of Sea Law, Sea Grant Publication UNC-SG-74-03, p 50-56, March 1974. 35 ref.

Descriptors: *International waters, *Internal waters(Jurisdiction), *International law, *Waterways, Straits, Gulfs, Bays, Channels, Shoreline, Navigable waters, Legal aspects, Law of the sea, United Nations, Harbor, Ocean, Coasts, Shores.
Identifiers: Territorial seas(Jurisdiction), *Territorial waters, Littoral states, Waters.

Egypt advanced the argument that the Strait of Tiran and Gulf of Aqaba are not international waters. The Strait of Tiran is the entrance to the Gulf of Aqaba, and the sole non-Mediterranean access to the high seas for Israel. Egypt, Saudi Arabia, Jordan, and Israel are littoral states on the Gulf. However, the one navigable channel into the Gulf forms part of the territorial waters of Egypt. On this basis Egypt has closed these waters to Israeli shipping. Egypt refuses to accept that Israel is a littoral state on the Gulf and claims Israel occupies the littoral position by virtue of armed aggression. The waters of the Gulf of Aqaba are historically the territorial waters of its littoral states and Israel is not an historic littoral state. Egypt further argues that the Arab States consider themselves at war with Israel and this entitles them to exercise belligerency rights. Finally, Egypt asserts that the Strait of Tiran does not join two portions of the high seas, or two international waters, and therefore is not an international waterway. (Chennault-Florida)

LEMMONS V. UNITED STATES (ACTION FOR DAMAGES FOR REVOCATION OF DREDGE PERMIT).
496 F 2d 864 (Ct Cl 1974).

Descriptors: *Ohio River, *Judicial decisions, *Mineral industry, *Leases, Sands, Gravels, Dredging, Excavating, Mining, Industries, Industrial production, Legal aspects, Navigable waters, Water demand, Water law, Water resources development, Industrial plants, Economic aspects, Rivers, Federal government, Contracts, Contract administration, Permits.
Identifiers: Licenses, Navigation obstructions.

Action was brought by the lessee under a sand and gravel lease to recover damages in the form of just compensation for the alleged taking of sand and gravel tipple and for the value of the leasehold interest. Plaintiff, a sand and gravel company, received a permit from the Army Corps of Engineers to allow sand and gravel dredging operations in the Ohio River. This permit was later revoked in an effort to improve river navigation. Plaintiff did not remove the tipple following the revocation of the permit. The plaintiff asserted that the tipple was annexed to the leasehold and must be considered a part of the realty. The court of claims held that the tipple did not constitute real property. Since the lessee indicated an intent to abandon the tipple, the lessee could not recover its value. The court held that the parties considered the lease as terminated. There was, therfore, no leasehold interest in existence which could be the subject of an illegal taking. (Proctor-Florida)

MARINE CONSERVATION COMMISSION (AS AMENDED).
Mississippi General Acts, No 10, Ch 572, H.B. No 1243, p 19-30, approved April 23, 1974 (1974).

Descriptors: *Mississippi, Legislation, *Jurisdiction, *Oysters, *Shellfish farming, Regulation, Commercial shellfish, Adoption of practices, State governments, Economic aspects, Decision making, Administrative agencies, Fishing, Administration, Commercial fishing, Shellfish, Administrative decisions, Water resources development, Enforcement.
Identifiers: Administrative regulations, State policy, Coastal zone management.

Any shells of marine organisms which are under or upon the tidewaters within the territorial jurisdiction of the state of Mississippi are the property of the state and under the jurisdiction of the Mississippi Marine Conservation Commission. The commission is to manage, control, supervise, and direct any matters pertaining to marine life not otherwise delegated to another agency. The commission will open, close and regulate fishing seasons for the taking of shrimp, oysters, fish taken for commercial purposes and crabs. With a permit issued by the Mississippi Marine Resources Council, the commission is authorized to support projects in the nature of digging or constructing canals in order to bring additional water to existing oyster reefs or beds, or to establish new reefs or beds. Fifty percent of all the oyster shells produced from the oysters processed within the state are declared to be the nontransferable property of Mississippi. Anyone taking oysters from the public reefs will deliver to the commission fifty percent of the shells, or the commission can, at its option, set reasonable compensation. (Sperling-Florida)

UNITED STATES V. HOLLAND (ACTION TO ENJOIN UNLAWFUL FILLING OPERATIONS).
373 F Supp 665 (MD Fla 1974).

Descriptors: *Judicial decisions, *Land development, *Federal Water Pollution Control Act, *Water pollution, Water pollution sources, Land resources, Water management(Applied), Land use, *Florida, Land management, Fisheries, Jurisdiction, Navigable waters, Permits, Enforcement, Legislation, Water resources development, Water law, Adjudication procedure, Administrative decisions.
Identifiers: Injunctive relief, FWPCA Amendments of 1972, Fill permits, Navigability tests.

Action was brought by the United States to enjoin allegedly unlawful land-filling operations in Florida. The government contended that the defendants, land developers, had begun filling the waters of the bayou with sand, dredged spoil and organic materials without permits required by the Federal Water Pollution Control Act (FWPCA). The plaintiff alleged that continued discharge would result in irreparable injury, loss and damage to aquatic ecosystems of the area and to commercial and sport fisheries. The court held that the facts established acts of sufficient scope to warrant federal jurisdiction under the FWPCA, and issued a temporary injunction. The Court reasoned that Congress is not limited by the 'navigable

waters' test in its authority to control pollution under the commerce clause. It determined that the defendants' filling activities on land periodically inundated by tidal waters constituted discharges entering waters of the United States. Since this activity was done without permits, it was in violation of the statute. (Proctor-Florida)

BOATS AND RIPARIAN RIGHTS,
M. C. Leonard.
Women Lawyers Journal, Vol 47, p 9-12, 1961.

Descriptors: *Navigable waters, *Riparian rights, *Competing uses, *Public rights, Common law, Civil law, Legal aspects, Legislation, Water law, Governments, Navigation, Recreation, Water utilization, Riparian waters, Natural use, Riparian land, Public access, Connecticut, Shore protection, Regulation, Environmental control, Wetlands, State governments.
Identifiers: Environmental policy, State policy, Public trust doctrine, Navigability tests, Water rights(Non-riparians).

In the United States, a stream is navigable in law if it is navigable in fact. The law is well settled that lands underlying navigable waters within a state belong to the sovereign and may be used or disposed of as it sees fit--subject to the power of Congress under the commerce clause. In addition to the rights common to the public, the riparian owner has the right of access from his property to the navigable part of the stream. This right is subordinate to the public right of navigation and subject to rules and regulations imposed for the protection of the public right. When there is a conflict between these interests, antiquated laws impede solutions. There is no uniform law on this subject in the United States. This should force states to review their laws and follow the lead of Connecticut in preserving shorelines for the use of the general public. In Connecticut, the public owns the shores of navigable waters. The land between the high and low water mark is held in trust by the state. (Proctor-Florida)

EXPLOITATION OF DEEP OCEAN MINERALS: REGULATORY MECHANISMS AND UNITED STATES POLICY,
University of Southern California, Los Angeles.
R. D. Eckert.
The Journal of Law and Economics, Vol 17, p 143-177, April 1974. 87 ref.

Descriptors: *Minerals, *United States, *Regulation, *International law, Oceans, Governments, Legal aspects, Adoption of practices, Cost-benefit analysis, Economic aspects, Natural resources, Water rights, Mining, Mineral industry, Engineering, Research.
Identifiers: United Nations, International agreements, Territorial waters, Coastal waters.

Valuable minerals lie on the ocean bed at great depths. Rising prices for metals and improvements in the techniques of ocean mining have made seabed mining economically feasible. Unregulated competition to mine seabeds could lead to international conflict. The policy of the United States favors international agreements as the best means to insure both world stability and United States access. Investment in discovery and mining equipment would be discouraged without the creation of property rights to specific deposits. A United Nations of the Sea Conference of more than one hundred and fifty nations has been mandated to reach agreement on an international regime to control access to deep sea minerals. Cost-benefit analysis is used to analyze information on current seabed mining practices and the effects future regulation will provide for their efficient exploration. (Sperling-Florida)

SCATTERING FORK DRAINAGE DISTRICT, COUNTY OF DOUGLAS V. OGILVIE (SUIT CHALLENGING LEGALITY OF PROPOSED CONSRUCTION OF WATER RESERVOIR PROJECT).
311 NE 2d 203 (111 app 1974).

Descriptors: *Illinois, *Judicial decisions, *Jurisdiction, *Governmental interrelations, *Administrative agencies, Drainage districts, State jurisdiction, Control, Water law, Legal aspects, Reservoirs, Environmental control, Damages, Constitutional law, Reservoir construction, Legislation, State governments, Federal government, Local governments, Water management(Applied), Regulation, Administration, Multiple-purpose reservoirs, Adjudication procedure.
Identifiers: Injunctive relief, Environmental policy.

The plaintiff drainage district, joined by two private citizens, sought an injunction restraining the defendants, state officials, from entering into certain agreements with the United States Corps of Engineers relative to the proposed construction of the Lincoln Reservoir Project. The plaintiffs alleged (1) that the defendants were obliged, before entering into such agreements, to obtain the consent of the plaintiffs to secure a court adjudication establishing their authority to so act; (2) that water damage which was compensable under state law would not be fully compensated for under the proposed agreements; (3) that the proposed action violated property owners' constitutional right to a healthful environment; and (4) that the proposed actions violated provisions of the Environmental Protection Act. The lower court dismissed the plaintiffs complaint, with prejudice, ruling that the plaintiffs failed to state a claim upon which relief could be granted. The Appellate Court of Illinois affirmed. The court found no authority to support the plaintiffs' first three contentions and ruled that the complaint failed to sufficiently allege any violation of the Environmental Protection Act. REPORT ON: ARIZONA INDIAN WATER RIGHTS CONFERENCE,
W. Anderson, and C. Pattea.
Arizona Commission of Indian Affairs, August, 1973. 73 p.

Descriptors: *Water rights, *Arizona, *Water requirements, Water demand, Irrigation water, Irrigable land.
Identifiers: *Arizona Indians, Indian reservations.

The purpose of this conference was to gather information and promote an understanding of Indian water rights in Arizona. Suggestions and recommendations were made by federal, state, and Indian tribal members in order to promote understanding and provide the means for handling water rights problems on the Indian reservations. Included in this report are the complete statements of federal, state, and Indian agency representatives present at this conference having expertise or jurisdiction over water rights on Arizona Indian lands. THE MODEL WATER CODE, THE WISE ADMINISTRATOR AND THE GODDAM BUREAUCRAT,
Wyoming Uni., Laramie.
F. J. Trelease.
Natural Resources Journal, Vol 14, No 2, April, 1974. p 207-229.

Descriptors: *Water management(Applied), *Water permits, *Riparian rights, *Planning, *Water quality administration, *Water law, *Water rights, Water utilization, Water requirements, Water policy, Water distribution, Water users.
Identifiers: Model Water Code.

Designed for an easterner seeking a new water law for his state, the Model Water Code developed by Frank Maloney, Richard C. Ausness, and J. Scott Morris places all waters under a single rule of law and a single administration. 'A State Water Resources Board sits above three divisions concerned with water use, water quality, and weather modification' with supervisory authority over as many management districts as are needed to adequately cover the state. Trelease focuses on the code chapter dealing with water use permits and the administrator's role. A permit is issued for a 'reasonable-beneficial' use consistent with the public interest, providing it does not interfere with existing uses and the state water plan. The fundamental problem is the choice between property rights and administrative distribution. The administrator is expected to exercise discretion in dealing with reduction, restriction, changes in permits, suspension of permits, apportionment , rotation, limitation or prohibition and can take direct actions in an emergency situation. The Administrator may well assume the role of a bureaucrat 'juggling equality, equity, economic efficiency, public health and safety, protection of investment and protection of workers' jobs and farmers' livelihoods.' 'The Code's solution to the legal uncertainties of riparian rights is the substitution of these administrative uncertainties.' Duration of permits, shifts of use, priorities and shortages.

perpetual rights and flexibility, evils of prior appropriation are each discussed in terms of the Model Code which neglects to deal with the disparity between east and west water needs and does not address the need for equitable and qualitative distribution of water resources and their uses. CONSERVATION AND FLOODING EASEMENTS: A CASE STUDY,
Pennsylvania Univ., Philadelphia. Inst. of Environmental Studies.
S. K. Slade.
December 1970. 21 p, 15 append. Federal Water Quality Administration, No. 16090 EDC.

Descriptors: *Water quality control, *Planning, *Water management(Applied), *Easements, *Water resources development, *Comprehensive planning, Water supply, Legal aspects, Eminent domain, Legislation, Local governments, Pennsylvania, Conservation, Administration.
Identifiers: *Bucks County(Penn), Neshaminy Creek(Penn), Neshaminy Water Resources Authority.

Although Pennsylvania possesses one of the strongest clean streams laws, the Commonwealth has not evolved any master plan for sewage disposal or water supply. Yet Bucks County by creating the Neshaminy Water Resources Authority has planned and acquired phases of a program for integrated water supply, water quality control, conservation, recreation and flood control on Neshaminy Creek. This study shows that planning coupled with knowledge of political realities and communication with the public brought this program into being and insured its success. Key factors in the program are affirmative approach to program; recognition of need to preserve quality of environment; assembly of competent planners and, most important, commitment of a large sum of money for land acquisition, engineering and construction costs, and contracts for scientific studies and tests. By undertaking the financial burdens, the County was able to acquire land through a planning program which encompassed appraisal, negotiating, condemnation and administrative (surveys, leasing policy) processes. The Neshaminy Program affords an excellent illustration of the implementation and problems in conducting an easement acquisition program. (Salzman-North Carolina)

U.S. V. ROHM AND HAAS CO. (CONTINUOUS DISCHARGE POLLUTION ACTION UNDER REFUSE ACT).
500 F.2d 167 (5th Cir. 1974).

Descriptors: *Judicial decisions, *Legal aspects, *United States, *Texas, *Rivers and Harbors Act, Federal Water Pollution Control Act, Waste water discharge, Channels, Navigable waters, Water pollution, Water pollution sources, Permits, Adoption of practices, Legislation, Decision making, Administrative agencies, Administration, Pollution abatement, Water pollution control.
Identifiers: FWPCA Amendments of 1972, Injunctive relief, Liability(Legal aspects).

The United States brought action against the operator of a chemical plant in Texas under the Refuse Act. The district court entered an injunctive order setting limitations on the amount of various pollutants the defendant could discharge into the channel and totally enjoining the defendant from barging such wastes out to sea. The Court of Appeals held that the action, which was instituted prior to the 1972 Amendments of the Federal Water Pollution Control Act, was within the saving clause of the 1972 Amendments which provided that where a permit for discharge had been applied for there could be no violation of the Refuse Act until December 31, 1974. The injunctive order was modified to govern the operators conduct only before the permit had been issued, and eliminated entirely the restriction on the barging of wastes to sea, since this was outside the scope of the Refuse Act. A polluter discharging wastes in accordance with terms and conditions of a permit is not in violation of the Refuse Act. (Sperling-Florida)
W75-04290

BIDERMAN V. MORTON (SEEKING INJUNCTION TO RESTRAIN CONSTRUCTION ON FIRE ISLAND PENDING ENVIRONMENTAL IMPACT STATEMENT).
497 F.2d 1141 (2d Cir 1974).

Descriptors: *Legislation, *Decision making, *Judicial decisions, *Federal government, *Adoption of practices, Permits, Construction, Administrative agencies, Government finance, Local governments, Environmental effects, Planning, Regulation, Water law, Administration, New York, Zoning, Federal jurisdiction, Environmental control, Adjudication procedure.
Identifiers: Injunctive relief, National Environmental Policy Act, Environmental impact statement, Environmental policy.

Action was brought against federal and nonfederal government officials seeking an injunction to restrain the issuance of construction permits and the granting of zoning variances on Fire Island pending the completion of an environmental impact statement. Preliminary injunctive relief was denied, and this denial was upheld on appeal. The Court of Appeals said such relief was inappropriate under the circumstances, noting that congressional funding of the Fire Island National Seashore Act had been essentially exhausted. Furthermore relief against the municipal defendants was barred by the failure of plaintiffs to identify a discernible basis for the exercise of federal injunctive power over these nonfederal officials. The Fire Island National Seashore Act does not prohibit any zoning action by the various local governments located on the seashore. (Sperling-Florida)

U.S. V. LEBEOUF BROS. TOWING CO., INC. (GOVERNMENT ACTION TO RECOVER PENALTY IMPOSED BY COAST GUARD FOR GASOLINE SPILL IN OCEAN).
377 F. Supp. 558 (ED Louisiana 1974).

Descriptors: *Judicial decisions, *United States, *Penalties(Legal), *Oil spills, Boats, Water pollution, Water pollution sources, Water pollution control, Adoption of practices, Federal Water Pollution Control Act, Economic aspects, Navigable waters, Regulation, Legal aspects, Water law, Adjudication procedure, Legislation, Oil pollution, Administration.
Identifiers: Evidence.

Action was brought by the United States to recover a penalty which had been imposed by the Coast Guard against a towing company. One of the towing company's vessels had spilled gasoline into the ocean. The district court held that the penalty was criminal in nature, despite the fact that the statute denominated it a civil penalty. This being so, a provision of the Federal Water Pollution Control Act, providing that reports of oil spills which were required to be made upon pain of criminal liability could not be used against one making the report in any criminal proceeding, applied in the instant case. The imposition of a penalty upon one who discharges oil upon navigable waters may be enforced only if it is supported by information derived independently from a report filed pursuant to the Act. The test for whether a statutory penalty is civil or criminal is whether the legislative aim was to punish the party for engaging in the activity or to regulate the activity. (Sperling-Florida)
W75-04292

MINNESOTA PUBLIC INTEREST RESEARCH GROUP V. BUTZ (ACTION FOR INJUNCTIONS AGAINST LOGGING IN BOUNDARY WATERS CANOE AREA).
498 F.2d 1314 (8th Cir 1974).

Descriptors: *Judicial decisions, *Adjudication procedure, *Administrative decisions, *Public lands, Federal government, Water law, Forest management, Legislation, Regulation, Environmental effects, Environment, Evaluation, Environmental control, Legal review, Land management.
Identifiers: *National Environmental Policy Act, Environmental impact statements, Wilderness areas, Wilderness Act.

Action was brought in the United States Court of Appeals by a nonprofit corporation seeking temporary and permanent injunction against logging in the Boundary Waters Canoe Area (BWCA) until the Forest Service complied with the requirements of the National Environmental Policy Act (NEPA). Plaintiffs allege that timber cutting authorized by the Forest Service constitutes a major federal action requiring compliance with NEPA. The plaintiffs contend that the logging activities should be banned in BWCA because they are incompatible with the requirements of the wilderness system of which BWCA is integral. The defendants argue that logging is specifically provided for in the BWCA by the Wilderness Act. The Court affirmed the judgment of the lower court, holding that the activities of the Forest Service in relation to timber sales constitutes major federal action significantly affecting the quality of the human environment. As a result the Court concluded that an environmental impact statement must be made. The appellate court also sustained lower court's grant of injunction not constituting an abuse of discretions. (Proctor-Florida)
W75-04293

OPINION OF THE JUSTICES TO THE HOUSE OF REPRESENTATIVES (RELATING TO THE CONSTITUTIONALITY OF A BILL CREATING

A PUBLIC 'ON-FOOT FREE RIGHT-OF-PASSAGE' ALONG SHORE OF COASTLINE).
313 N.E.2d 561 (Mass 1974).

Descriptors: *Right-of-way, *Legal aspects, *Public access, Judicial decisions, Real property, Eminent domain, Navigable waters, Shores, Constitutional law, Common law, Public rights, Water law, Water resources development, State governments, Massachusetts, Legal review, Adjudication procedure, Legislation, Compensation, Public benefits, Riparian rights.
Identifiers: *State policy, *Declaratory judgments, *Water rights(Non-riparians).

A question was propounded by the House of Representatives to the Justices of the Supreme Judicial Court of Massachusetts relating to the constitutionality of a bill creating a 'public on-foot free right-of-passage' along the shore of the coastline between the mean high water line and the extreme water line subject to certain restrictions. The right-of-way stemming from the reserved interests of the public in the land is only to be exercised after sunrise and is not to be exercised in those areas designated by the Commissioner of the Department of Natural Resources as being of critical ecological significance. The court was of the opinion that if enacted, the ordinance would violate the provisions of the Constitutions of the Commonwealth of Massachusetts and the United States. The bill would amount to a taking of private property for public purposes without due compensation and would therefore be violative of the 'due process' strictures of the state and federal constitutions. (Proctor-Florida)
W75-04294

FREEMAN COAL MINING CORP. V. ILLINOIS POLLUTION CONTROL BOARD (APPEAL FROM OF POLLUTION CONTROL BOARD HOLDING THAT DEFENDANT MADE ILLEGAL DISCHARGES).
313 N.E.2d 616 (Ill App 1974).

Descriptors: *Water pollution, *Water pollution sources, *Acid mine water, *Water pollution control, *Pollution abatement, *Judicial decisions, Mining, Mining wastes, Coal mines, Water quality, Water quality control, Waste treatment, Damages, Discharge(Water), Water law, Water resources development, Illinois, Administrative decisions, Adjudication procedure, Treatment facilities, Environmental control, Legal review.
Identifiers: *Effluent limitations, *Liability(Legal aspects).

An appeal was made to the Illinois Appellate Court from an order of the Pollution Control Board requiring a coal mining corporation to desist from polluting water in violation of the State Water Pollution Regulations, and to maintaiits water treatment facility in a condition sufficient to meet effluent criteria promulgated by the Pollution Control Board. The petitioner argues that it should not be liable for the discharges because such discharges result from rainwater, a natural force beyond the control of petitioner, interacting with mining sludge, which was created prior to the enactment of the regulations. The Court found that the mine owner, by building a treatment facility for the acid runoff water and by making subsequent improvements, had intended to control the discharges. Therefore, petitioner was estopped from using a defense of lack of control over the discharge. Petitioner's intentions go only to the mitigation of damages. The court also held that even though the treatment to prevent pollution discharges imposed a financial burden on the petitioner, this was no defense and does not excuse petitioner from the responsibility to treat the discharges. (Proctor-Florida)
W75-04295

RESERVE MINING CO. ET. AL. V. UNITED STATES (MOTION FOR STAY OF INJUNCTION).
498 F2d 1073 (8th Cir 1974).

Descriptors: *Minnesota, *Judicial decisions, *Legal aspects, *Pollution abatement, Public health, Water law, Federal jurisdiction, Water pollution, Water pollution sources, Water pollution control, Water pollution effects, Water quality control, Federal government, State governments, Governmental interrelations, Federal Water Pollution Control Act, Air pollution, Air pollution effects, Asbestos, Industrial wastes, Pollutants, Waste disposal, Lake Superior, Mineral industry, Iron, Adjudication procedure, Legal review, Legal aspects, Planning.
Identifiers: Evidence, Injunctive relief, *Hazardous substances, Nuisance(Legal aspects), Refuse Act of 1899.

The federal government, joined by several state governments and environmental groups, brought action seeking an injunction barring the corporate defendants from continuing operation of their taconite ore processing plant located at Silver Bay, Minnesota. The plaintiffs contended that the plant's discharge of asbestiform particles into the air and Lake Superior violated federal and state pollution standards and presented an immediate public health hazard. A Federal District Court ordered the plant closed and the defendants appealed. The defendants moved for a stay of the injunction pending their appeal, contending that the evidence did not support the lower court finding that their operations constituted a public health hazard. The Eighth Circuit Court of Appeals held that evidence showing that the discharges might result in a health hazard did not support a ruling that such hazard did indeed exist. The court stayed the injunction, conditioned upon the defendants taking prompt steps to abate the discharges and submitting their plans for on-land disposal and control of air emissions to the court for review. (Deckert-Florida)
W75-04296

FORD MOTOR CO. V. DALLAS POWER AND LIGHT CO. (ACTION FOR PROPERTY DAMAGE RESULTING FROM RELEASE OF WATERS FROM DAM DURING TIME OF FLOODING).
499 F2d 400 (5th Cir 1974).

Descriptors: *Judicial decisions, *Texas, *Surface runoff, *Dams, Electric powerplants, Legal aspects, Economic aspects, Flooding, Legislation, Water law, Flood damage, Natural flow, Water resources, Water rights, Legal review, Floodwater, Discharge(Water), Water injury, Overflow, Negligence, Adjudication procedure.
Identifiers: *Liability(Legal aspects).

A case in the Fifth Circuit Court of Appeal concerned personal property damage resulting from the defendant power company's release, during a time of flooding, of waters through the power company's dam. The district court in Texas narrowed the case to one based on negligence and denied recovery on answers of contributory negligence. The fifth circuit reversed holding that interrogatories were improperly refused which attempted to base liability on a theory similar to strict liability. Under Texas law, negligence is not a critical factor in assessing liability for water damage where there has been a violation of the Texas Surface Water Act. Under this act liability results when there is a diversion of surface water from its place of natural flow, resulting in an injury to the owner of a lower estate. Under Texas law where a substantial invasion of land of another through the interference with the flow of surface water is intentional, liability depends on whether the invasion is unreasonable. (Sperling-Florida)

UNITED STATES V. BOYD (DISCHARGE OF OIL INTO NAVIGABLE WATERS).
1 Pollution Control Guide, Vol 3, paragraph 15067, p 15487-15491, June 3, 1974.

Descriptors: *Federal Water Pollution Control Act, *Oil spills, *Navigable waters, *Control, *Judicial decisions, United States, Legislation, Water quality standards, Administrative agencies, Environment, Regulation, Public health, Water quality, Ships, Shores, Protection, Oil pollution, Administration, Water quality control, Federal government, Pollution abatement.
Identifiers: *Federal Water Quality Improvement Act, Standing(Legal), Hazardous substances(Pollution), Evidence.

Defendant ship captain appealed from the decision of the federal district court in a criminal action brought by plaintiff United States charging defendant with discharging oil into navigable waters of the United States and not immediately notifying the appropriate federal agency pursuant to the Federal Water Pollution Control Act. The main issue was whether defendant had discharged oil in harmful quantities (sheen test). The district court convicted defendant, suspended sentence, and placed him on one year probation. On appeal defendant primarily contended that the sheen test improperly defined as harmful a broader class of oil discharges than Congress intended and was, therefore, invalid. Defendant next contended that the sheen test was devised to achieve workable administration, thereby subverting Congressional intent. Defendant further contended that the exception to the sheen test--discharges of oil from a properly functioning vessel engine--demonstrated the irrationality of the test. Finally defendant contended that the Act unconstitutionally denied him due process because, when coupled with the sheen test, it was too vague. The Court of Appeals rejected these contentions. It ruled that the sheen test was not unreasonable, vague, or unconstitutional and, thereupon, ordered the judgement of the district court affirmed. (Chennault-Florida)
W75-04298

VERMONT V. NEW YORK, ET AL. (PROPOSED CONSENT DECREE DISAPPROVED).
1 Pollution Control Guide, Vol 3, paragraph 15069, p 15499-154503, June 10, 1974. 7 ref.

Descriptors: *Water pollution control, *Discharge(Water), *Judicial decisions, *Adjudication procedure, Sludge, Sediments, Waste water, Interstate compact, Jurisdiction, Equitable apportionment, *New York, *Vermont, Wastes, Effluents, Water level, United States, Regulation, Standards, Dredging, Compacts, Ponds, Lakes, Tributaries, Navigation, Interstate, Governmental interrelations, Enforcement, Water quality control, Water quality standards.
Identifiers: *Nuisance(Legal aspects).

Plaintiff State of Vermont brought suit in the United States Supreme Court alleging that defendants State of New York and paper company were responsible for a sludge bed in its state waters which polluted the water, impaired navigation, and constituted a public nuisance. Issue was joined and a Special Master was appointed. The United States intervened as an interested party. The parties reached a settlement, in the form of a consent decree, which the Special Master recommended to the Court for approval. The proposed consent decree stipulated that no findings be made and that its provisions not constitute an adjudication on any issue of fact or law. It also requested the appointment of a special master who would police the execution of the proposed decree and submit to the Court for its approval his proposed resolutions of future contested issues. The Court rejected the decree and refused to appoint a Special Master. The Court concluded that such a decree would force it to act as an arbitrator of disputes and would thus extend the judicial power

of the Court beyond its constitutional limitations. (Chennault-Florida)
W75-04299

UNITED STATES V. IRA. S. BUSHEY AND SONS, INC. (DISCHARGE OF REFUSE INTO NAVIGABLE WATERS--OIL SPILLS),
1 Pollution Control Guide, Vol 3, paragraph 15077, 15541-15550, 1974.

Descriptors: *Rivers and Harbors Act, *Oil spills, *Water pollution, *Navigable waters, Oil pollution, Regulations, United States, Navigation, Environmental effects, Beaches, Lakes, Barges, Recreation, Oil, Gasoline, Wildlife, Environment, Water users, Water supply, Vermont, Federal Water Pollution Control Act, Judicial decisions, Federal government.
Identifiers: *Refuse Act of 1899, *Injunctive relief.

Plaintiff United States brought action to obtain injunctive relief against defendant corporate shipowner, whose vessels, in repeatedly discharging oil into the Vermont waters of Lake Champlain, had irreparably damaged beaches, public water supplies, waterfowl and fish, violated the provisions of the Refust Act, and created a public nuisance. The facts were uncontroverted. The Federal Water Pollution Control Act Amendments of 1972 did not preclude granting equitable relief and the Refuse Act of 1899 made such relief available. The United States District Court found that plaintiff was entitled to equitable relief, and ordered that defendant be permanently enjoined to operate and supervise all vessels and personnel employed by it in Lake Champlain to comply with the requirements specified by plaintiff, which were not in conflict with the authority of the United States Coast Guard of with provisions of the navigation rules for harbors, rivers and inland waters. PEOPLE (N.Y.) V. CUDAK (PROSECUTION FOR VIOLATING MORATORIUM ON ALTERATION OF TIDAL WETLANDS),
358 N.Y.S.2d 909 (Dist Ct Suffolk Cty 1974).

Descriptors: *New York, *Judicial decisions, *Regulation, *Tidal marshes, *Law enforcement, Environmental control, Environmental effects, Administration, Water law, State governments, State jurisdiction, Legal aspects, Marshes, Wetlands, Administrative agencies, Legislation, Coastal marshes, Management, Water quality control, Water policy, Penalties(Legal), Preservation, Conservation, Adjudication procedure, Adoption of practices.
Identifiers: Administrative regulations, Coastal zone management, State policy, Liability(Legal aspects).

The defendants, an individual and a corporation, were prosecuted by the state of New York for allegedly violating the state's moratorium on alteration of tidal wetlands by dumping fill on or adjacent to wetlands. Section 25-0202 of the Environmental Conservation Law proscribes the alteration of any tidal wetland or any area immediately adjacent to such wetland which the Commission of Environmental Conservation may reasonably deem necessary. The Commissioner had determined that such adjacent area would extend 300 feet landward but had not recorded the ruling with the Secretary of State. The District Court, Suffolk County, ruled that under New York law, the ruling was not effective as a regulation until it had been so recorded. The court also ruled that, under the statute, it had no power to determine on a factual or case-by-case basis whether a particular area was 'adjacent' to a tidal wetland. Accordingly, on finding that the state failed to prove beyond a reasonable doubt that the defendants had dumped their fill directly onto wetlands, the court found the defendants not guilty. THE DELAWARE ESTUARY SYSTEM, ENVIRONMENTAL IMPACTS AND SOCIO-ECONOMIC EFFECTS. ANNEX TO VOLUME I. MANAGEMENT AGENCY PROBLEMS IN THE DELAWARE ESTUARY,
Delaware Univ., Newark; and Academy of Natural Sciences of Philadelphia, Pa.
W. V. McGuinness, Jr.
Final Report (partial) April, 1973. 92 p, 3 fig, 2 tab, 6 append.

Descriptors: *Management, *Estuaries, *Planning, *Water management, *Waste disposal, *Delaware, *Estuarine environment, *Pollution abatement, Water control, Waste treatment, Water pollution, Water quality, Water consumption, Water law, Water policy, Water sources, Water treatment, Water utilization, Water conservation, Research priorities, Leadership, Decision making, Administration.
Identifiers: *Delaware Estuary System(Delaware), RANN, Problem matrix, Societal priorities.

Major estuarine-related management areas and related problems in the Delaware Estuary are identified and ranked according to societal priorities. Key managers were interviewed, and priorities were determined from their collective views. Management areas ranked as follows: highest-waste disposal; high-comprehensive planning and management, recreation, institutional and legal, and shipping; medium-commercial fishing, wetlands management, commercial land use, and residential land use; low-water supply, shore erosion, preservation and aesthetics; and lowest-sand and gravel extraction. Included is a problems matrix of four priorities, with fourteen problem areas listed for each. Under Priority A, for example, is included abating unrecorded pollution, regionalization, unrecorded pollution loads, urban waterfront renewal, wetland values, biological implications, deep water ports, capability to support basic uses, land use management techniques, dredge spoil disposal, cost effectiveness in pollution control, attitudes and education, and translating research into action. Criteria for selecting the 56 problems included the number of interviewees who cited it, the emphasis placed on it, the stature of the interviewee, and the judged significance of not solving the problem. GUIDELINES FOR PREPARATION OF ENVIRONMENTAL STATEMENTS FOR REVIEWING AND COMMENTING ON ENVIRONMENTAL STATEMENTS BY OTHER FEDERAL AGENCIES.
Environmental Protection Agency, Seattle, Wash. Region X.
Available from National Technical Information Service, Springfield, Va. 22161, as PB-226 998, $4.25 in paper copy, $2.25 in microfiche. April 1973. 249 p.

Descriptors: *Comprehensive planning, *Environmental control, Environment, Water resources development, Water pollution, Air pollution, Water pollution control, Management, Legislation, Agencies, Coordination, Water law, Pollution abatement, Water management(Applied), Interagency cooperation.
Identifiers: *Environmental Impact Statements, *Environmental policy, *National Environmental Policy Act.

An objective of the United States Environmental Protection Agency (EPA) is to assist other government agencies in developing an environmental ethic for their planning and action programs. This function assures that environmental values receive equal consideration with economics and need in the federal decision making process. Environmental Impact Statements (EIS) are the vehicles to accomplish environmental evaluations. Carefully planned and prepared EIS must be the unvarying rule if the environment is to be protected. Guidelines to be followed in preparing the EIS are presented. Included are sections on the National Environmental Policy Act, content of EIS, general guidelines, guidelines for specific projects such as dredging and spoil disposal and water resource development, and regional review procedures. Also included are pertinent federal statutes, executive orders, and memos from the Council on Environmental Quality and the Office of Management and Budget. (Proctor-Florida)

WATER RESOURCES APPRAISAL FOR HYDROELECTRIC LICENSING, THE CLARION RIVER BASIN, PENNSYLVANIA.
Federal Power Commission, Washington, D.C. Bureau of Power.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 232 186, $4.25 paper copy, $2.25 microfiche. Appraisal Report, 1974. 61 p, 24 fig, 14 tab.

Descriptors: *Water resources development, *Hydroelectric project licensing, *Powerplants, Flood control, Hydroelectric power, Water quality control, Water supply, Dams, Recreation, Fish, Wildlife, Watersheds(Basins), Evaluation, Reclamation, *Pennsylvania.
Identifiers: *St. Petersburg reservoir(Penn), Clarion River Basin(Penn).

Information was provided to use in considering hydroelectric licensing, relicensing, or recommendation for Federal takeover of the Clarion River basin. A comprehensive plan for flood control, hydroelectric power generation, water quality control, water supply, recreation, fish and wildlife enhancement, and land reclamation was found to be economically feasible by the Corps of Engineers in its 1969 study of the Appalachian Region. Construction of the St. Petersburg reservoir would inundate the existing Piney hydroelectric project and preclude the development of the possible dam sites at Foxburg and at Mill Creek, and Cooksburg. The potential projects, Mill Creek, Cooksburg, and Foxburg, are alternative developments to the St. Petersburg project. The alternatives are less favorable than St. Petersburg and were not expected to be seriously considered. (Dawes-ISWS)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No. HY1, Proceedings paper No. 11053, p 17-27, January 1975. 6 fig, 4 equ, 6 ref.

Descriptors: Hydraulics, Hydrology, *Information retrieval, *Data processing, *Computer programs, *Hydrologic data, Optimization, Least squares method, Water resources, Costs.
Identifiers: Data reduction, Data systems.

The determination of what portion of data is or is not needed to describe a phenomenon is partly a problem of economics. One can examine the tradeoff between the loss in relative accuracy of the reduced data and the savings in computer and storage costs. Three numerical methods are presented for reducing the quantity of data required to define the time series of relatively stable hydrologic parameters. The feasibility of each method is examined, showing the associated savings in computation time and data storage (and therefore in cost). The percentage reduction obtained depends on the allowable measurement and approximation error and the percentage of time this total error may be exceeded. The hydrologic data used in this study suggest that reductions of 25% or more may be possible without a significant loss of accuracy if the measured data are within 5% - 10% of the true value 95% of the time. THE OBSERVATION-WELL NETWORK OF THE U.S. GEOLOGICAL SURVEY IN FLORIDA,
Geological Survey, Tallahassee, Fla.
H. G. Healy.
Florida Bureau of Geology Map Series No. 65, 1974. 1 sheet, 1 fig, 2 tab, 3 ref.

Descriptors: *Observation wells, *Florida, *Basic data collections, *Hydrologic data, Water levels, Water quality, Sampling, *Maps.

An observation-well network has been established throughout Florida to evaluate the status of groundwater resources in each aquifer. The network provides basic documentation of the effects of natural variations and the effect of man on the groundwater resource. The network also provides the data by which the potential of the groundwater resources can be determined. The observation-well network is part of the statewide hydrologic monitoring network used to evaluate the total water resources of the State. The network is constantly being revised in response to the varying needs brought about by water-resource problems and application of new hydrologic techniques. Water-level measurements are made on a continuous or periodic basis. The frequency of measurement is determined primarily by the use of the record. In addition to the water-level monitoring netowrk, an extensive quality-of-groundwater network is maintained by the U.S. Geological Survey in Florida. Water samples were being collected for chemical analyses from 509 wells in 34 counties as of January 1974. (Knapp-USGS)

WATER-RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY IN THE NORTHERN GREAT PLAINS COAL REGION OF EASTERN MONTANA, 1974-75.
Geological Survey, Helena, Mont.
Open-file report, January 1975. 22 p, 8 fig.

Descriptors: *Basic data collections, *Groundwater, *Surface waters, *Montana, *Coal mines, Water supply, Streamflow, Water yield, Hydrologic data.

A water data-collection program and interpretive hydrologic investigations are being conducted by the U.S. Geological Survey in the Northern Great Plains coal region of eastern Montana, an area of intense interest for coal companies, utilities, State and Federal agencies, universities, landowners, and environmental groups. In October 1974 there were 39 surface-water and 47 water-quality stations in the region for collection of streamflow, chemical-quality, sediment, and temperature data. These stations are located on all types of streams from the main-stem Yellowstone and Missouri Rivers to small ephemeral and intermittent streams that drain proposed mine areas. Groundwater investigations are being conducted to determine the areal hydrology of the Madison Group and associated Paleozoic rocks and the areal and site hydrology of shallow aquifers in the Fort Union Formation, including the coal beds. Available data, mostly from oil tests, indicate that the Madison may yield water suitable for use in energy development in the Northern Great Plains coal region. Most of the field work in the shallow groundwater study is a partial data inventory of wells and springs and construction of a few wells for water sampling, aquifer testing, and water-level measurements. A computer model is being constructed to determine the effect on stream temperature of selected increases in withdrawal rates, and thus reduced flow, of the Yellowstone River from Billings to Sidney, Montana. (Knapp-USGS)
W75-03977

WATER-RESOURCES DATA COLLECTED IN THE DEVILS HOLE AREA, NEVADA, 1973-74,
Geological Survey, Las Vegas, Nev.
J. D. Larson.
Open-file report, 1974. 12 p, 7 fig, 1 tab, 1 ref.

Descriptors: *Water levels, *Withdrawal, *Springs, *Nevada, Killifishes, Irrigation water, Hydrogeology, Basic data collections, Hydrologic data, Regimen.
Identifiers: *Devils Hole pupfish.

Water-level, spring-flow, and power-consumption data were collected in the Devils Hole area of Nevada from July 1973 through June 1974. Continuous recorders were used to monitor water levels in Devils Hole, two observation wells, and the flow from four springs. Also, monthly readings were made on two wells to help define a general trend of groundwater levels. Monthly meter readings of six electrically powered irrigation wells provided a record of power consumption, which in turn is a measure of the amount of water pumped. The purpose of the work is to observe the effects of groundwater withdrawals for irrigation on the level in Devils Hole and the flow from the major springs in the area. The pool in Devils Hole,

which is a collapsed fault structure, is the only native habitat of desert pupfish, Cyprinodon diabolis. (Knapp-USGS)

DAM BUILDING SYSTEM,
G. L. Malan.
U.S. Patent No 3,845,631, 6 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 55, November 5, 1974.

Descriptors: *Patents, *Dams, *Concrete dams, *Dam construction, Equipment, Water control, Construction, Engineering structures, Concrete structures.

A pool is formed upstream of the dam site; a floating platform bearing a concrete mixing plant is placed in the pool; and concrete is discharged from the mixing plant at a placement site on the damsite so as to build the dam and to increase its height. The pool is permitted to deepen as the dam rises so that the mixing plant approximately rises with the dam, whereby the concrete is mixed at a location relatively close to a placement site. The floating platform may be supported on pontoons which may be connected to pumps which can variably flood or evacuate them so as to change elevation of the platform relative to the surface of the pool. A means is provided for the safe and closely coupled mixing and placement of concrete on a dam. The requirement for conventional cableways with all of their inconveniences and risks is eliminated, and a mixing plant can be placed only a few feet away from the actual placement site. The mixing plant can conveniently be moved back and forth laterally along the upstream face of the dam. The materials of construction can handily be supplied to the mixing plant and can be kept cool, both in storage and on their way to the mixing plant. (Sinha-OEIS)

PNEUMATIC BARRIERS TO REDUCE SALT INTRUSION THROUGH LOCKS,
Waterloopkundig Laboratorium, Delft (Netherlands). Density Currents Branch.
G. Abraham, P. van der Burgh, and P. de Vos.
Rijkswaterstaat Communications, No. 17, Government Publishing Office, The Hague, The Netherlands, 1973. 68 p, 21 fig, 3 tab, 15 photo, 79 equ, 18 ref.

Descriptors: *Saline water intrusion, *Locks, *Canals, Hydrodynamics, Hydraulics, Sea water, Fresh water, Evaluation, Design criteria, Ships, Water quality control, *Saline water barriers, *Barriers.
Identifiers: *Pneumatic barriers, North Sea(The Netherlands).

In the Netherlands, salt intrusion through locks on the coast is a serious threat to the water quality in the 'collector' canals linked with the locks. The various means of controlling sea water intrusion through locks are evaluated. The mechanism of salt intrusion through the lock is examined; considered are intrusion due to equalization of levels, the pattern produced when lock gates separating saline and fresh water are opened, and the effect of displacement of ships. After briefly considering current practices in the Netherlands, the hydrodynamics of pneumatic barriers are discussed. Described are a continuity equation, a momentum equation, and a mathematical solution. Design criteria for pneumatic barriers in locks are examined and their upkeep is explained. Among the measures of reducing salt intrusion, the exchange of salt water for fresh water while the lock gates are closed is the most effective (and most expensive) method. Pneumatic barriers constitute a simple, convenient and cheap method which will not keep out all the salt but will reduce intrusion considerably. The pneumatic barrier method of preventing salt intrusion is suitable for practically all the locks adjoining the sea in the Netherlands. Measures for new locks should be considered for each case individually. Pneumatic barriers can be combined with alternative means. (Bell-Cornell)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No. HY1, Proceedings paper No. 11080, p 167-188, January 1975. 12 fig, 3 tab, 31 equ, 16 ref.

Descriptors: Hydraulics, *Pipelines, *Pumping, *Water distribution(Applied), *Dynamic programming, *Conduits, Design, Computer programs, Irrigation, Transmission lines, Optimization, Costs, Methodology, Networks, Systems analysis, Equations, Computer models, Flow.
Identifiers: Systems engineering.

The capability of a dynamic programming conduit design technique has been expanded to cover systems with diverging branch pipelines. An interactive computer programming approach is used in the optimization design. Design applies to complete turbulent, transient, as well as laminar, flow conditions. The decision variable, pipe size, assumes only pipe sizes that are available on the market. The sum of all cost phases, which includes pipe material cost, power cost, and wasted water cost, is used as a criterion for measuring the overall system effectiveness. The interactive approach, as opposed to the previously-used batch process, proves to be superior in the flexibility of allowing human decision and in the reduction of computation time. This expansion of the prior calculation method has been used successfully many times in solving different problems. It can handle various diverging branch type fluid networks; moreover, the dynamic programming technique is applicable to analysis and design of a more complex water system. (Bell-Cornell)

METHOD AND APPARATUS FOR BREAKING WAVES,
M. L. Edwards.
US Patent No 2,851,476, 5 p, 6 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 929, No 1, p 58, December 3, 1974.

Descriptors: *Patents, *Shore protection, *Beach erosion, *Breakwaters, Waves(Water), Beaches, Coastal structures.
Identifiers: *Wave action.

The base of an artificial shore machine is anchored to the bed or floor near the shore of the body of water to be controlled. The anchor is any conventional anchorage means, such as legs or posts which penetrate into the sea floor to maintain the base in position. The shore machine may be supported at the desired depth by attachment to a ship, a barge, or other convenient float, and may thus also be used quite far from shore. A relatively flat platform is attached to the base by means of a hinge along the side of the base closest to the incoming waves, and generally most distant from the shore. The end of the platform away from the approaching waves is then free to move on the hinge upward and downward to vary the slope of the platform and the height of the edge of the platform away from the waves (nearest the shore). A double acting hydraulic cylinder is connected between the base and the platform to move the platform up and down relative to the base, in controlled fashion. The hydraulic cylinder is remotely controlled by means of hydraulic oil lines connected to a conveniently located remote control station on the shore or on board a ship (or barge) near the machine. The machine thus artificially induces waves to break in a controllable fashion, at an earlier time, and at a generally fixed location farther from shore, than would otherwise occur. (Sinha-OEIS)
W75-03868

DEVICE FOR PRODUCING AND PROTECTING DEPOSITS OF SEDIMENTARY MATERIAL ON THE FLOOR OF BODIES OF WATER,
O. J. F. Larsen.
U.S. Patent No 3,844,123, 5 p, 22 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 1838, October 29, 1974.

Descriptors: *Patents, *Shore protection, *Beach erosion, Equipment, Erosion, Deposition, Sands, Littoral drift, Sand bars, Sediment control.
Identifiers: *Wave action, Offshore bars.

A device is described for deposition and protecting sand and other littoral drift material on the floors of seas, lakes, rivers and other bodies of water where the bed and sides consist of erosionable material. The device is placed at a certain level above the floor, thereby allowing for a height of the deposition underneath the device greater than corresponding to the height of the device itself. Plane or curved, flexible or stiff-plate-like members are disposed to form a surface in upwardly spaced relation to and generally parallel to the floor. The waves and currents thereby loose a part of the material drifting underneath this surface. The consequent deposition of material is protected by the depositing device against scouring. The plate-like members may form a continuous, flexible carpet or stiff plate, or individual, interspaced elements. Where the purpose is creation of offshore bars for coastal protection and reforming, the device is raised according as deposition of the drift material takes place, so that one layer of material is precipitated on top of the other until the required height is reached. (Sinha-OEIS)
W75-03871

TRANSVERSE MIXING IN RIVERS; A NUMERICAL APPROACH,
Waterloopkundig Laboratorium, Delft (Netherlands). Mathematics Branch.
G. K. Verboom.
Reprint paper from: The XVth IAHR Congress, Istanbul, September 2-7, 1973. Publication No. 117, Delft Hydraulics Laboratory, the Netherlands, March 1974. 14 p, 5 fig, 1 tab, 10 equ, 4 ref, 1 append.

Descriptors: *Rivers, *Mixing, Hydraulics, *Numerical analysis, Concentration, Measurement, Downstream, Upstream, Model studies, Simulation analysis, Advection, Diffusion, Dispersion, Flow, Velocity, Channels, Equations, Systems analysis.
Identifiers: *Transverse mixing, *Conservation equation, *Finite-difference method, Transverse dispersion coefficient, IJssel River(Netherlands), Non-buoyant material, Discharged material.

To study the transverse mixing in rivers numerically, the conservation equation of the released material is solved, using a fourth order accurate finite-difference method that has small numerical diffusion and dispersion. After preliminary computations to study the accuracy of the results, the concentration is calculated of a conservative, non-buoyant material released into a model of a river. From concentration measurements in this model and other characteristic features of the stream, Holley calculated the transverse dispersion coefficient with the general change of momentum method. Herein, this coefficient is used to find the concentration distribution. The agreement is quite satisfactory, giving support to the numerical method as well as to the analytical method by which the dispersion coefficient was found. (Bell-Cornell)
W75-03917

MODEL-PROTOTYPE COMPARISONS FOR TRANSVERSE MIXING IN RIVERS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
E. R. Holley, and M. Karelse.
Reprint paper from: XVth IAHR Congress, Istanbul, September 2-7, 1974. Delft Hydraulics Laboratory, Publication No. 116, The Netherlands, March 1974. 12 p, 2 fig, 1 tab, 6 equ, 13 ref.

Descriptors: *Rivers, Hydraulics, *Model studies, *Streamflow, *Mixing, Downstream, Discharge(Water), Measurement, Depth, Velocity, Turbulence, Diffusion, Effluents, Water quality, Equations, Systems analysis.
Identifiers: *Transverse mixing, Longitudinal mixing, Concentration distribution.

The problem under consideration is transverse mixing downstream from an outfall discharging at a steady rate into a river. It is assumed that: (1) the material being injected is conservative; (2) depth-averaged values can be used so that only the transverse and longitudinal variations of the quantities of interest need to be considered; and (3) longitudinal mixing can be neglected for the steady state concentration distribution. Analytical considerations are reviewed relative to the model reproduction of the mixing process. An undistorted model can correctly reproduce the transverse diffusion in the prototype, but the diffusion in a distorted model will be too great relative to the prototype. Comparisons of model and prototype concentration measurements are presented for an undistorted model of one river and for a distorted model of another river. These data comparisons substantiate the previous statements about the reproduction of diffusion. If diffusion is a significant mechanism in the process to be studied, a distorted hydraulic model should not be used. (Bell-Cornell)
W75-03918

DIGGING IN OF ANCHORS INTO THE BOTTOM OF THE NORTH SEA,
Waterloopkundig Laboratorium, Delft (Netherlands).
J. Koster.
Publication No. 129, The Delft Hydraulics Laboratory, The Netherlands, June 1974. 17 p, 2 fig, 7 photos, 1 tab, 62 ref.

Descriptors: *Anchors, *Hydraulics, *Pipelines, *Bibliographies, Depth, Damages, Data collections, Ships.
Identifiers: *North Sea(Netherlands), *Ocean floor, Depth of penetration.

Oil or gas pipelines are expected to be laid on the Dutch section of the bottom of the North Sea. Utmost care will have to be taken to keep these pipelines from leaking. Damages to dug in pipelines, apart from those caused by bottom fluctuations, may be caused also by anchors caught behind the pipeline. This can be prevented by applying on the pipeline a top layer of ground which is thicker than the depth to which the anchor digs

into the bottom (penetration depth). To study the possible digging in of anchors, a literature review was made. This report includes a list of all known literature relating to ships' anchors and a discussion of data taken from the literature. The summary of information is restricted to types of anchors that dig in without outside help or the use of explosives. Considered are: (1) ships' anchors, including stock, stockless, and non-stockless patent anchors; and (2) work anchors, including various patent anchors. The behavior of the various types of anchor in sandy, clay, and muddy bottoms is examined. (Bell-Cornell)

SOME HYDRODYNAMICAL ASPECTS OF GRAVITY-TYPE PLATFORM DESIGN,
Waterloopkundig Laboratorium, Delft (Netherlands).
J. van der Weide.
Reprint from: Paper presented at Inter Ocean '73, Dusseldorf, November 13-18, 1973. Delft Hydraulics Laboratory, Publication No. 120, March 1974. 15 p, 12 fig, 26 equ, 8 ref.

Descriptors: Hydraulics, *Hydrodynamics, *Waves, *Design data, Caissons, Stability, Depth, Height, Deep water, Shallow water, Piles(Foundations), Gravity, Equations, Methodology.
Identifiers: *Platform design, *Wave forces, *Design graphs, Production platforms, Spectral analysis.

In recent years, the concept of gravity-type production platforms has been introduced as an alternative to the traditional pile-supported platforms. For the design of these structures, wave forces under design conditions are of primary importance. Available techniques to obtain these forces are reviewed. Design graphs are given to facilitate the determination of wave forces on large objects, such as caissons for gravity-type structures. From the graphs, the wave loads in both regular and irregular waves can be computed. Horizontal forces for piles with both square and circular cross-sections, as obtained from the graphs, are in good agreement with values measured in model experiments. Results are valid for conditions where the wave profile can be approximated by the first order wave theory, which implies waves of moderate steepness in relatively deep water. When computing forces due to shallow water waves, the results obtained from the graphs may be used as a first approximation. Model tests with the final design are recommended to check the preliminary design data obtained from the graphs. (Bell-Cornell)
W75-03924

STOPPING DISTANCES OF V.L.C.C. IN IJMUIDEN,
Waterloopkundig Laboratorium, Delft (Netherlands).
J. Koster.
Reprint from: De Nederlandse Loods, 16e jaargang, No. 3, June 1974. Publication No. 123, Delft Hydraulics Laboratory, The Netherlands, March 1974. 10 p, 7 fig, 3 ref.

Descriptors: *Ships, *Harbors, *Measurement, Velocity, Distance, Simulation analysis, Equations, Experiments, Data collections, *Hydraulics, Resistance.
Identifiers: *Stopping maneuver, Stopping length, Tugboats, Speed, Amsterdam(The Netherlands), IJmuiden(The Netherlands).

As long as the dimensions of ships have been growing, the discussion about stopping distances of giant vessels has taken place. Especially in harbors, the stopping maneuver is worth a separate study, since the available stopping length is limited and a minimum velocity is required in order to enter the harbor safely. Much data are available about the stopping maneuver under the conditions of crash-stop trials at high sea. However, conditions in harbors are different; they are characterized by confined water (in depth and width), low speeds, tug assistance and maneuvers with rudder and propeller to keep course. For this reason, the existing computational methods to determine the stopping length at high sea have been adapted for application in harbors. The computation can determine the required stopping length under severe conditions, when tests are unwarranted. Some prototype measurements have been carried out to calibrate this new computational method. Measurements were made in the harbor of IJmuiden, where several extensions to sluices and breakwaters are making the entrance route rather complicated. (Janet Bell-Cornell)

LINEAR WAVE PROPAGATION PROBLEMS AND THE FINITE ELEMENT METHOD,
Waterloopkundig Laboratorium, Delft (Netherlands). Mathematics Branch.
J. C. W. Berkhoff.
Reprint paper from: The International Symposium on Finite Element Methods in Flow Problems, Swansea, January 7-11, 1974. Publication No. 124, Delft Hydraulics Laboratory, March 1974. 29 p, 19 fig, 81 equ, 13 ref.

Descriptors: Hydraulics, *Waves(Water), *Model studies, *Finite element analysis, Equations, Structures, Harbors, Refraction(Water waves), Computers, Systems analysis.
Identifiers: *Linear wave propagation, *Harmonic linear waves, *Wave forces.

Mathematical models for the computation of water wave propagation problems restricted to simple harmonic linear, irrotational waves have been developed during the past ten years in the field of wave forces on structures, harbor oscillations, diffraction, refraction and the combined phenomenon of refraction and diffraction. A survey is presented of these modeling techniques for which the numerical treatment can be classified as finite element analysis. Described are the mathematical formulation, the methods of solution, and the relation between the different models. The models yield quantitative or qualitative information concerning the effect of waves on structures or harbors. The main restriction of these models is the numerical requirement of about five computing points over one wave length to compute the potential function with an accuracy of roughly five percent. For the combined refraction-diffraction model, this requirement is a rigid one with respect to computing time and computer memory in the case of a large area compared with the mean wave length. However, it is possible to divide the whole area of interest into subareas for which different models can be applied and to join the different solutions in an appropriate way. (Bell-Cornell)

EXPERIENCES WITH TIDAL SALINITY MODEL EUROPOORT,
Delta Works, The Hague (Netherlands). Hydraulics Div.; and Waterloopkundig Laboratorium, Delft (Netherlands).
A. J. van Rees, P. van der Kuur, and H. J. Stroband.
Reprint paper from: The 13th International Conference on Coastal Engineering, Vancouver, Canada, July 10-14, 1972. Publication No. 125, Delft Hydraulics Laboratory, June 1974. 21 p, 8 fig, 4 ref.

Descriptors: *Coastal engineering, *Hydraulic models, *Tides, *harbors, Simulation analysis, Water level, Salinity, Dispersion, Silts, Rivers, Currents(Water), Data collections, Research, Density currents, Estuaries, Mathematical models, Systems analysis, Flow.
Identifiers: *Shipping, Seaports, North Sea(The Netherlands), Rotterdam Waterway Estuary(The Netherlands), Water transportation, Tidal movements.

A tidal salinity model for the harbor entrance at Rotterdam-Europoort was constructed in 1965. Described in detail are the preliminary studies, the setting up of the model, the boundary conditions, and use of the model in experimental studies. The model includes a part of the North Sea and the Rotterdam Waterway Estuary. For its regular adjustment, use could be made of extensive prototype measurements, two-dimensional tidal computations and tidal computations by means of the DELTAR (analogue, one-dim.). The model has proved to be very valuable for predicting stream patterns for nautical purposes, allowing shipping to continue without danger while the works were being carried out. The model has been used also for the solution of harbor problems (design, siltation), for predicting cooling water recirculation, and for advice on salinity intrusion problems. (Bell-Cornell)

LABORATORY STUDIES ON TRANSVERSE MIXING IN RIVERS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
E. R. Holley, and G. Abraham.
Reprint from Journal of Hydraulic Research, Vol 11, No 3, 1973. Publication No. 127, Delft Hydraulics Laboratory, The Netherlands, June 1974. 35 p, 12 fig, 2 tab, 7 equ, 8 ref.

Descriptors: *Rivers, *Streams, *Mixing, Hydraulics, *Simulation analysis, *Laboratory tests, Analytical techniques, Least squares analysis, Equations, Model studies, Flow, Tracers, Channels, Depth, Velocity, Concentration, Flumes, Width, Experiments, Data collections, Systems analysis.
Identifiers: *Transverse mixing, *Lateral dispersion, IJssel River(Netherlands), Bed-shear turbulence, Groins, Bends, Helical motion, Chezy coefficients, Displacement, Non-buoyant tracers.

Described are some laboratory studies made with non-buoyant tracers to investigate the mixing under simulated stream conditions and the possible significance of mechanisms which are in addition to bed-shear turbulence and which contribute to the transverse mixing. Experiments were conducted for (1) a straight rectangular flume with simulated groins, and (2) an undistorted, fixed bed river model with groins. The flows considered are characterized by (1) variations in depth and width (2) extra side roughness, as protective works (groins) are present, and (3) bends. As a result of these characteristics, the transverse spreading of a non-buoyant tracer is influenced by: (1) turbulence, which may be non-uniformly distributed as a result of side roughness; (2) helical motion associated with channel bends; and (3) net transverse velocities. Transverse velocities from changes in channel geometry cause transverse displacements of the tracer plume. The displacement must be considered when using measured distributions of tracer concentrations to study transverse mixing; the applicability of a method of doing so is demonstrated. The transverse mixing problem can be treated using a transverse dispersion coefficient. The generalized change of moments method of analysis using data obtained for a simulated river is useful in showing some consistency in data which appeared to be inconsistent based on the traditional change of moments analysis. Descriptors: *Model studies, *Thermal water, *Froude number, *Hydraulic models, *Hydraulic structures, *Lake Ontario, Mixing, Jets, Dispersion, Turbulence, Momentum transfer, Entrainment, Harbors, Waste dilution, Discharge(Water).
Identifiers: *Diffusers, Densimetric Froude number, Thermal discharge.

Two specific aspects of thermal hydraulic model simulation were described. The results obtained from the study of a particular thermal discharge are applicable to other design situations. The use of an undistorted, two-dimensional model for investigating in detail the flow and mixing characteristics of a thermal discharge diffuser was discussed. Methods for calibrating distorted scale models to provide satisfactory prototype simulation were detailed. Guidelines for the initial design of a diffuser structure were presented. Identifiers: *Canal theory, *Linear transport theory, *Radiative transfer theory, *Boundary value problems, Wave propagation.

The practical problems of linear surface-wave transport in nonuniform canals reduce principally to four main types: general responses to external and internal sources, seiches, resonances, and network problems. In each type of problem the geometry and physical parameters of the canals were given, and it was required to predict the time dependent or steady state (time-harmonic) wave amplitudes within the canals. These problems were reformulated for the time-harmonic case by using the concepts and methods of linear transport theory as they have been developed principally in the neighboring fields of geophysical radiative transfer theory and electric network theory. By applying the transport ideas of these two fields to classic canal theory, new mathematical and numerical procedures were developed in each of the four main problem domains. The mathematical procedures themselves fall into four classes: analytic, algebraic, product and quotient functionals, and inter-relations among these classes. The applications were summarized and illustrated by means of a selected set of graphs. Detailed comparisons between the present approach and the classic approach were made. DETERIORATION OF CONCRETE DITCH LINERS IN SALINE-ALKALI SOIL,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
L. B. Grass, and P. Koluvek.
Journal of the Irrigaion and Drainage Division, Proceedings of the American Society of Civil Engineers. Vol. 100, No. IR4, December, 1974. p 477-484, 3 fig, 2 tab, 10 ref.

Descriptors: *Irrigation ditches *Salinity, *Concrete-lined canals, *Deterioration, *Chemical degradation, berms, Saline Soils, Soil moisture, Calcium, Sodium, Heating, Cracks, Stress, Arid Lands, Solar radiation, *California.

Deterioration of portland cement concrete ditch liners has been noted in Imperial Valley, California. Deterioration has taken place in less than 10 years in some cases and is most severe on the north slope of east-west ditches and the east slope of north-south oriented ditches. Both chemical and physical reactions are responsible for the gradual softening of the concrete ditch liners. Cracking is due to the differences in temperature above and below the water level which accelerates chemical corrosion by continually exposing new surfaces. The most rapid and severe deterioration occurs at the top of the liner and decreases toward the bottom of the ditch, as saline solutions (particularly sodium and calcium) migrate from the soil by capillarity into the concrete mass. As water enters a heated ditch stresses are created by differential temperatures above and below the water lines, and the liner, already weakened by chemical stresses, will crack. This accounts for greater damages to the slopes exposed to maximum sunlight and heat. The problem can be avoided by interrupting the flow of moisture into the concrete. This can be done by using a more dense concrete mass having a lower porosity, by scheduling water application during the cooler part of the day to avoid undue stress, and using a soil low in salt content when building the berm. Studies of Renovation of Pulp Mill Waste Water; The Conditions of the Percolation Through Activated Carbon Column for Kraft Pulp Lignin (In Japanese),
W75-03883 5D

Soil Adsorption of Humic Color,
W75-04043 5D

Wastewater Treatment, Physical and Chemical Methods, (Literature Review),
W75-04121 5D

Models of Dispersion in a Granular Medium,
W75-04340 2F

AEDES SOLLICITANS
Additional Studies of the Effects of Salt Marsh Impoundments on Mosquito Populations,
W75-04048 5G

AERATED LAGOONS
Static Mixing Concept for Aerators Wins Acceptance,
W75-03914 5D

Study of the Seasonal Effects on the Microbiology of a Northern Pulp and Paper Mill Aeration Lagoon,
W75-03916 5D

AERATION
Effectiveness of the Pre-Aerator (Effektivnost' raboty pre-aeratora),
W75-03905 5D

Static Mixing Concept for Aerators Wins Acceptance,
W75-03914 5D

Prediction of Oxygen Transfer Rate in Air Bubble Aeration,
W75-04253 5D

AERATORS
Liquid Aerating Apparatus,
W75-03875 5D

AERIAL PHOTOGRAPHY
Usefulness of ERTS-1 and Supporting Aircraft Data for Monitoring Plant Development and Range Conditions in California's Annual Grassland,
W75-03990 4A

Determining Land Use Changes in Watersheds by Aerial Photographic Measurements,
W75-04051 4C

AEROSOLS
Problem Definition Study: Evaluation of Health and Hygiene Aspects of Land Disposal of Wastewater at Military Installations,
W75-04015 5D

Vertical Distribution of Radioactive Aerosols in the Troposphere Over the European USSR in 1964-1967,
W75-04055 5B

Formation of Radioactive Particles During Nuclear Bursts in the Troposphere,
W75-04067 5B

The Atmospheric Formation of Secondary Aerosols During Ventilated Underground Nuclear Tests,
W75-04069 5B

Size Distribution of High-Activity Particles in the Troposphere in September-December 1967,
W75-04070 5B

Filtering Aerosols with Natural Atmospheric Radioactivity Through Fibrous Materials,
W75-04091 5A

Development of a Method for Determining the Size Distribution of Radioactive Aerosols with the Aid of Filtering Materials,
W75-04092 5A

Preliminary Data on the Measurement of the Atmospheric Aerosol Characteristics with a Centrifugal Spectrometer,
W75-04093 5A

Measuring the Concentration of Highly-Disperse Radioactive Aerosols by the Diffusion Method,
W75-04094 5A

AEROSOLS

Spectrometric Method of Measuring the Concentration of Natural Radioactive Aerosols,
W75-04098 5A

AERSOLS
Comparison of the Characteristics of Hygroscopic and Non-Hygroscopic Aersol Washout by Cloud-Borne Drops,
W75-04075 5B

AFRICA
A Review of Desertization in Africa--Water, Vegetation, and Man,
W75-04142 2J

AGE EFFECT
Age Factors for Dose Rates From an Infinite Cloud of a Photon Emitter,
W75-04176 5C

AGRICULTURE
Water Utilization and Agricultural Development in Western Uttar Pradesh,
W75-03950 3F

Some Considerations on Plant Types for Dryland Agriculture,
W75-04126 2I

AGRO-INFORMATION
Water Utilization and Agricultural Development in Western Uttar Pradesh,
W75-03950 3F

AIR DRYING
Characterization and Dewaterability of Water Treatment Plant Residues,
W75-04039 5D

AIR ENTRAINMENT
Prediction of Oxygen Transfer Rate in Air Bubble Aeration,
W75-04253 5D

AIR POLLUTION
Radioactive Isotopes of Europium Produced by Nuclear Blasts,
W75-04058 5A

Accumulation of Strontium-90 in Soils,
W75-04062 5B

Some Features of Atmosphere Cleansing by Ground Condensation,
W75-04078 5A

Relation Between Atmospheric Precipitation Washout of Radio-Activity and Nonactive Ions,
W75-04079 5B

Cosmogonic Sodium-22 and Beryllium-7 Isotopes in Investigations of Atmospheric Dynamics,
W75-04081 5B

Seasonal Beryllium-7 Variations in Ground Level Air,
W75-04084 5A

Concentration of Phosphorus Radioisotopes in the Ground Layers of the Atmosphere and in Precipitation,
W75-04086 5A

Radium-226 in Atmospheric Precipitation, and the Possibilities for Lead-210, Bismuth-210 and Polonium-210 to Penetrate the Atmosphere from the Earth's Surface,
W75-04087 5A

Polonium-210 in the Atmosphere and its Ratio to Lead-210,
W75-04088 5A

Time Fluctuations of Lead-210 Concentration in the Ground Layer of the Atmosphere,
W75-04089 5A

Separate Determination of Rn, RaA, RaB, and RaC Concentrations in Air from the Alpha-Activity Decay Curve of a Filter,
W75-04095 5A

Entrainment of Stratospheric Tritium: Another Radiological Anomaly of the Rocky Mountain West,
W75-04162 5A

As Low as Practicable: A Critical Appraisal of Population Health Risks from Power Plant Effluents,
W75-04163 5A

Trends in Population Radiation Exposure from Operating BWR Gaseous Effluents,
W75-04165 5B

Dosimetry of Internal Emitters for Population Exposure,
W75-04172 5C

A Metabolic Model for Whole Body and GI Tract Retention in a Human Infant Deduced from Experimental Data on Suckling Rats Administered a Single Oral Dose of Cerium-141 at Different Ages,
W75-04175 5C

Health Effects of Fossil Fuel Power Plants,
W75-04180 5C

Population Exposure to Natural Terrestrial Gamma Radiation Around Selected Nuclear Power Plant Sites,
W75-04193 5A

ALABAMA
Cooling Towers - Best Achievable Thermal Pollution Abatement Technology,
W75-04223 5D

ALASKA
Preconstruction Assessment of Biological Quality of the Chena and Little Chena Rivers in the Vicinity of Chena Lakes Flood Control Project Near Fairbanks, Alaska,
W75-03988 5B

Temperature Regimes and Classification of Some Well-Drained Alpine Soils in Alaska,
W75-04314 2G

ALBEDO
The Three Stages of Drying A Field Soil,
W75-03965 2D

ALGAE
A Continuous Flow Kinetic Model to Predict the Effects of Temperature on the Toxicity of Waste to Algae,
W75-04052 5C

Interactions Between Light and Carbon Dioxide Availabilities as a Control of Algal Species Succession,
W75-04148 5C

Phytoplankton Enrichment Experiments and Bioassays in Natural Coastal Sea Water and in Sewage Outfall Receiving Waters Off Southern California,
W75-04283 5C

The Effect of Cadmium on Population Growth in the Green Alga Scenedesmus Quadracauda,
W75-04284 5C

Effect of Turbidity on Algal Growth,
W75-04306 5C

ALGAL CONTROL
Interactions Between Light and Carbon Dioxide Availabilities as a Control of Algal Species Succession,
W75-04148 5C

ALGAL SPECIES SUCCESSION
Interactions Between Light and Carbon Dioxide Availabilities as a Control of Algal Species Succession,
W75-04148 5C

ALGORITHMS
CRE: A Method for Solving Probability Problems Related to Hydrologic Time Series,
W75-04310 2E

ALLUVIAL CHANNELS
A Set of Regime Equations For Indirectly Estimating Stream Flow Characteristics,
W75-04245 2E

ALPINE SOILS
Temperature Regimes and Classification of Some Well-Drained Alpine Soils in Alaska,
W75-04314 2G

ALTAHAMA GEORGIA SOUTHERN AREA
Water and Sewer Management Study, Altamaha Georgia Southern Area.
W75-04196 5G

ALTERNATIVE WATER USE
The Development of Supplemental Water: Resource Flexibility and Farm Management Options,
W75-04031 3F

AMBIENT CURRENT EFFECTS
Ambient Current Effects on Vertical Selective Withdrawal in a Two Layer System,
W75-04049 4A

AMMONIUM CHLORIDE
Effects of CCC on Drought Resistance of Triticum Aestivum L and Zea Mays L,
W75-04011 3F

AMMONIUM SALTS
Process and Device for Purification of Effluents Containing Phenols and Ammonium Salts,
W75-03859 5D

ANAEROBIC CONDITIONS
Sulfate Reduction and Sulfide Oxidation in Flooded Soil as Affected by Chemical Oxidants,
W75-04347 5E

Conversion of DDT to DDD in Flooded Soil,
W75-04348 5E

ANAEROBIC DIGESTION
Mixing in Anaerobic Digestion,
W75-04120 5D

ANALOG MODELS
Application of Analog Techniques to Water Management,
W75-04202 6A

ANALYTICAL TECHNIQUES
Special Techniques for Determining Chemical Properties of Geothermal Water,
W75-03980 2K

An Automated Method for the Determination of Formaldehyde in Sewage and Sewage Effluents,
W75-04112 5A

Planning for Water Quality in the Virgin River System in the State of Utah: A Program for Developing a Comprehensive Water Quality Management Plan.
W75-04206 5G

Analytical Model for a Heated Submerged Discharge into Break Water Wall Area,
W75-04214 2H

Two-Dimensional Transient Hydro-Thermal Mathematical Model,
W75-04219 2H

ANCHORS
Digging in of Anchors into the Bottom of the North Sea,
W75-03919 8B

ANIMAL GROUPINGS
Benthos and Allochthonous Organic Matter in Streams,
W75-04119 5B

ANOPHELES MOSQUITOES
Additional Studies of the Effects of Salt Marsh Impoundments on Mosquito Populations,
W75-04048 5G

APPROXIMATE PROBABILITY DENSITY FUNCTION
The Approximate Probability Density Function of Range and Adjusted Range,
W75-04246 6A

AQUACULTURE
Biological Processes Involved in Pollution of Coastal Aquaculture Waters,
W75-04281 5C

AQUATIC ENVIRONMENT
Kinetics of Microbiologically Mediated Transformations of Heavy Metals in Aquatic Environments,
W75-03945 5B

Aquatic Survey of the Kona Coast Ponds, Hawaii Island,

CARBOFURAN

Comparative Biochemistry, Biodegradability, and Toxicity of DDT and Carbofuran Analogues,
W75-04034 5C

CARBON

A Summary and Comparison of Nutrients and Related Water Quality in Lakes Erie, Ontario, Huron, and Superior,
W75-04027 5B

A Survey of Organic Carbon Constituents in Natural Fresh Waters,
W75-04252 5B

CARBON-14

Large Scale Nuclear Gas Stimulation: Population Doses Estimated in the Environmental Assessment of Carbon-14 Releases,
W75-04186 5A

CARBON-14 GASES

C-14 Gaseous Effluent From Pressurized Water Reactors,
W75-04171 5A

CARBON DIOXIDE

Interactions Between Light and Carbon Dioxide Availabilities as a Control of Algal Species Succession,
W75-04148 5C

CARBONATES

Effect of Sulfuric Acid and Sulfur Dioxide on the Aggregate Stability of Calcareous Soils,
W75-03952 2G

Loess Distribution on a Wisconsin-Age Till Plain in Southwestern Ohio,
W75-04320 2G

CAUSTIC ALKALI

Process and Device for Purification of Effluents Containing Phenols and Ammonium Salts,
W75-03859 5D

CENTRIFUGATION

Solving Effluent Problems by the Use of Centrifuges,
W75-03942 5D

CENTRIFUGES

Solving Effluent Problems by the Use of Centrifuges,
W75-03942 5D

CERIUM

State of Strontium-90, Cesium-137, and Cerium-144 in Radioactive Fallout,
W75-04071 5B

A Metabolic Model for Whole Body and GI Tract Retention in a Human Infant Deduced from Experimental Data on Suckling Rats Administered a Single Oral Dose of Cerium-141 at Different Ages,
W75-04175 5C

CESIUM

Prediction of Radioisotope Concentrations in Freshwater Streams,
W75-03852 5B

Rate of Atmospheric Fallout of Cesium-137 and Strontium-90 Aerosols,
W75-04061 5A

Cesium-137, Strontium-90, and Lead-210 in Soil of the Far North Regions,
W75-04063 5B

Comparative Distribution of Strontium-90 and Cesium-137 in Different Types of Soils,
W75-04064 5B

State of Strontium-90, Cesium-137, and Cerium-144 in Radioactive Fallout,
W75-04071 5B

Graphoanalytical Method for Determining Cesium-137 Concentration in Soil Samples from the Gamma Spectrum,
W75-04101 5A

CHANNEL IMPROVEMENT

Disposal of Polluted Dredgings from the Great Lakes Area,
W75-04251 5B

CHANNEL LINERS

Irrigation Ditch Liner and Method for Making Same,
W75-03863 4A

CHANNEL MORPHOLOGY

The Hydraulic Geometry of a Discontinuous Ephemeral Stream in a Bajada Near Tucson, Arizona,
W75-04125 2E

A Set of Regime Equations For Indirectly Estimating Stream Flow Characteristics,
W75-04245 2E

CHANNELS

A Set of Regime Equations For Indirectly Estimating Stream Flow Characteristics,
W75-04245 2E

CHEMICAL ANALYSIS

Special Techniques for Determining Chemical Properties of Geothermal Water,
W75-03980 2K

Experimental Data for Hygienic Standardization of Dihydroperoxide Meta-Diisopropylbenze in Surface Waters, (In Russian),
W75-04319 5C

CHEMICAL DEGRADATION

Deterioration of Concrete Ditch Liners in Saline-Alkali Soil,
W75-03966 8F

CHEMICAL OXIDANTS

Sulfate Reduction and Sulfide Oxidation in Flooded Soil as Affected by Chemical Oxidants,
W75-04347 5B

CHEMICAL OXYGEN DEMAND

Soil Adsorption of Humic Color,
W75-04043 5D

Dichromate Relux Chemical Oxygen Demand: A Proposed Method for Chloride Correction in Highly Saline Wastes,
W75-04124 5A

CHEMICAL PRECIPITATION

Selection of Coagulants for Treatment of Excess Activated Sludge (Vybor koagulyantov dlya obrabotki izbytochnogo aktivnogo ila),
W75-03894 5D

Corrugated Ink and Starch Wastes Meet EPA Standards at St. Regis.
W75-03907 5D

CHEMICAL REACTIONS

Experimental Methods for Obtaining Percol Model Input and Verification Data,
W75-04276 5B

CHEMICAL SLUDGE

Characterization and Dewaterability of Water Treatment Plant Residues,
W75-04039 5D

CHEMICAL TREATMENT

An Overloaded Sludge Plant. Try Chemical Treatment,
W75-04123 5D

CHEMICAL WASTES

Control Methods for Waste Waters and Solutions of Specific Substances (Metodi di controllo di acque di scarico e soluzioni di sostanze specifiche),
W75-03885 5B

Use of Waste Chemicals in Kraft Mill Effluent Treatment,
W75-03891 5D

Spill Prevention and Control Aspects of Paper Industry Waste Water Management Programs,
W75-03912 5G

CHENA RIVER (ALASKA)
Preconstruction Assessment of Biological Quality of the Chena and Little Chena Rivers in the Vicinity of Chena Lakes Flood Control Project Near Fairbanks, Alaska,
W75-03988 5B

CHESAPEAKE BAY
The Thermal Requirements and Tolerances of Key Estuarine Organisms,
W75-03944 5C

CHICAGO (ILLINOIS)
How Chicago Manages its Distribution System,
W75-04197 6C

CHLORIDE COMPOUNDS
Effects of CCC on Drought Resistance of Triticum Aestivum L and Zea Mays L,
W75-04011 3F

CHLORIDES
Nitrate and Chloride Accumulation and Distribution in Fertilized Tile-Drained Soils,
W75-04022 5B

Dichromate Relux Chemical Oxygen Demand: A Proposed Method for Chloride Correction in Highly Saline Wastes,
W75-04124 5A

CHLORINATED PARAFFINS
Uptake of Chlorinated Paraffins and PCB from Suspended Solids and Food by Juvenile Atlantic Salmon,
W75-04286 5C

CHOCTAWHATCHEE RIVER
Flood Plain Information: Choctawhatchee River, Pea River, Double Bridges Creek, City of Geneva, Alabama.
W75-04212 4A

CHROMATOGRAPHY
A Highly Sensitive Technique for the Liquid Chromatographic Analysis of Phenols and Other Environmental Pollutants,
W75-03911 5A

CHROMIUM
New Spectrophotometric Method for the Estimation of Hexavalent Chromium in Water,
W75-04113 5A

CHRYSAORA
Enhancement of Recreational Uses of Estuarine Waters Through Study of Potential Control Methods for Stinging Sea Nettles,
W75-04037 5C

CITIZEN PARTICIPATION
Protecting Creeksheds, Analysis and Action,
W75-03948 4D

CITY PLANNING
Management of Water Resources for Urban Environmental Enhancement,
W75-04151 6B

CLARIFICATION
An Overloaded Sludge Plant. Try Chemical Treatment,
W75-04123 5D

CLARIFIERS
Improved Clarification of Book Mill Effluent,
W75-03902 5D

CLASSIFICATION
The Dilution Capacity of Small Streams in South Carolina,
W75-04050 5B

Setting up a Special Collection on Water Pollution in a University Library,
W75-04118 5G

CLAY LOAM
Effect of Moisture Regimes and Green Manuring on Ferrous Iron Concentration in Soil and Growth and Yield of Paddy,
W75-04318 3F

CLAY MINERALS
Mechanistic Response of Expansive Clays,
W75-03955 2G

Effects of Natural Microbial Preparations on the Electrokinetic Potential of Bacterial Cells and Clay Minerals,
W75-04317 5B

CLAY-WATER SYSTEM
Mechanistic Response of Expansive Clays,
W75-03955 2G

CLAYS
Mechanistic Response of Expansive Clays,
W75-03955 2G

The Effect of Gypsum Treatment on the Swelling of Natural Clods of a Clay Soil,
W75-04132 2G

A Gamma Transmission Method for the Determination of Moisture Content in Soils,
W75-04343 2G

CLIMATIC DATA
Usefulness of ERTS-1 and Supporting Aircraft Data for Monitoring Plant Development and Range Conditions in California's Annual Grassland,
W75-03990 4A

CLIMATOLOGY
Some Characteristics of Upper Clouds and Suggestions Regarding the Utilization of Radioactive Tracers in Meridional Flows,
W75-04059 2B

Mean and Turbulent Transfer of Substances Over the USSR,
W75-04060 2B

CLODS (SOIL)
A Flotation Method for the Rapid Measurement of the Wet Bulk Density of Soil Clods,
W75-04135 2G

CLOUDS
Some Characteristics of Upper Clouds and Suggestions Regarding the Utilization of Radioactive Tracers in Meridional Flows,
W75-04059 2B

Trace Elements and Natur Radioactivity in Cloud Water and Atmospheric Precipitation in the Central Caucasus Mountains,
W75-04108 5A

COAGULATION
Selection of Coagulants for Treatment of Excess Activated Sludge (Vybor koagulyantov dlya obrabotki izbytochnogo aktivnogo ila),
W75-03894 5D

Improved Clarification of Book Mill Effluent,
W75-03902 5D

Wastewater Treatment, Physical and Chemical Methods, (Literature Review),
W75-04121 5D

COAL MINES
Water-Resources Investigations of the U.S. Geological Survey in the Northern Great Plains Coal Region of Eastern Montana, 1974-75.
W75-03977 7C

COALS
Health Effects of Fossil Fuel Power Plants,
W75-04180 5C

COASTAL AQUIFERS
The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

COASTAL ENGINEERING
Experiences with Tidal Salinity Model Europoort,
W75-03927 8B

COLIFORMS
Study of the Seasonal Effects on the Microbiology of a Northern Pulp and Paper Mill Aeration Lagoon,
W75-03916 5D

COLOR
The Attempts to Modify the Activated Sludge Process in Sulphate Pulp Waste Water (In Japanese),
W75-03882 5D

Soil Adsorption of Humic Color,
W75-04043 5D

COLORADO
General Disposition and Aquatic Environmental Effects of Silver Iodide in Precipitation Management,
W75-04255 3B

More Streamflow After a Bark Beetle Epidemic,
W75-04342 4C

COMMUNITY DEVELOPMENT
Management of Water Resources for Urban Environmental Enhancement,
W75-04151 6B

COMPACTION
Second-Order Theory of Flow in Three-Dimensional Deforming Media,
W75-04308 2F

COMPETING USES
Boats and Riparian Rights,
W75-04006 6E

COMPREHENSIVE PLANNING
Guidelines for Preparation of Environmental Statements for Reviewing and Commenting on Environmental Statements by Other Federal Agencies.
W75-04010 6G

Whither Water.,
W75-04025 6B

Conservation and Flooding Easements: A Case Study,
W75-04211 6E

Enhancing Water Resource Planning Effectiveness: A Simulation Gaming Approach,
W75-04233 6A

Reservoir Operation Through Objective Trade-Offs,
W75-04345 4A

COMPRESSIBILITY
Mechanistic Response of Expansive Clays,
W75-03955 2G

COMPUTER MODELS
Computation of Tides, Currents, and Dispersal of Pollutants in the New York Bight from Block Island to Atlantic City with Large Grid Size, Single and Two-Layer Hydrodynamical-Numerical Models, Part 4,
W75-04262 5B

COMPUTER PROGRAMS
Data Reduction Methods for Hydrologic Analyses,
W75-03929 7C

The Processing and Storage of Water-Quality Data in the National Water Data Storage and Retrieval System,
W75-03970 7C

The Use of an Automated Population Data Base in Population Exposure Calculations,
W75-04157 5A

Condos-A Model and Computer Code to Estimate Population and Individual Radiation Doses to Man From the Distribution, Use and Disposal of Consumer Products That Contain Radioactive Materials,
W75-04182 5B

COMPUTERS
Toward a Science Policy for Computers in Water Resources: Trends and Issues,
W75-04257 6A

CONCRETE DAMS
Dam Building System,
W75-03873 8A

CONCRETE-LINED CANALS
Deterioration of Concrete Ditch Liners in Saline-Alkali Soil,
W75-03966 8F

CONDEMNATION
United States v. 21.54 Acres of Land, Marshall County, West Virginia (Condemnation Case for Flowage Easements Near Dam Site).
W75-03993 6E

CONDENSATION
Milti-Stage Flash Evaporator,
W75-03860 3A

Hot Ball Desalination Process,
W75-03878 3A

CONDENSERS
Development of a Complete Mathematical Model for Describing the Point Beach Nuclear Power Plant Thermal Plume,
W75-04238 5B

CONDUITS
Self-Cleaning Filter for Hydrological Regeneration,
W75-03864 5D

Design of a Conduit System with Diverging Branches,
W75-03930 8A

CONFERENCES
Water for the Human Environment, Volume IV, Special Sessions.
W75-04213 5B

CONJUNCTIVE USE
Integrated System Identification and Optimization for Conjunctive Use of Ground and Surface Water, Phase II,
W75-03853 4B

CONNECTICUT RIVER
Some Biological Aspects of Aquatic Thermal Discharges,
W75-04225 5C

CONSERVATION EQUATION
Transverse Mixing in Rivers; A Numerical Approach,
W75-03917 8B

CONSTRAINTS
Chance-Constrained Dynamic Programing and the Optimization of Water Resource Systems,
W75-03934 4A

CONSTRUCTION MATERIALS
Regional Landfill and Construction Material Needs in Terms of Dredged Material Characteristics and Availability; Volume I: Main Text,
W75-04266 5G

CONTROL
United States V. Boyd (Discharge of Oil into Navigable Waters).
W75-04298 6E

CONTROL SYSTEMS
Application of Micro-Controllers Melmic 100 to Water Treatment Facilities, (In Japanese),
W75-04338 5D

CONVECTION-DIFFUSION EQUATION
Methods for Estimating Transport Model Parameters for Regional Groundwater Systems,
W75-04271 2F

COOLING
Heat Dissipation from Turbulent Open Channel Flow,
W75-04350 5B

COOLING TOWERS
Dry-Type Cooling Systems in Electric Power Production,
W75-04221 5D

Cooling Towers - Best Achievable Thermal Pollution Abatement Technology,
W75-04223 5D

COOLING WATER
Evaluation of Water Temperature Fields Resulting from Heated Water Discharges,
W75-04215 5B

Cooling Pond Temperature Prediction,
W75-04222 5B

Thermal Pollution Aspects in Europe,
W75-04226 5B

A Combined System Concept for Power Generation and Wastewater Renovation,
W75-04227 5D

Development of a Complete Mathematical Model for Describing the Point Beach Nuclear Power Plant Thermal Plume,
W75-04238 5B

CORN (FIELD)
Effect of Soil Temperature on Direction of Corn Root Growth,
W75-03954 3F

Effects of CCC on Drought Resistance of Triticum Aestivum L and Zea Mays L.,
W75-04011 3F

Effect of a Killed Sod Mulch on Nitrate Movement and Corn Yield,
W75-04013 3F

Corn Root-Configuration Response to Soil Temperature and Matric Suction,
W75-04288 3F

Effect of Level Terraces on Soil Moisture Content and Utilization by Corn,
W75-04315 3F

CORRELATION ANALYSIS
Relation Between Atmospheric Precipitation Washout of Radio-Activity and Nonactive Ions,
W75-04079 5B

COSMIC RAYS
Argon Spallation Yields of Cosmogonic Radioisotopes,
W75-04082 5B

COSMOGONIC RADIOISOTOPES
Cosmogonic Sodium-22 and Beryllium-7 Isotopes in Investigations of Atmospheric Dynamics,
W75-04081 5B

Argon Spallation Yields of Cosmogonic Radioisotopes,
W75-04082 5B

COST ANALYSIS
Economic Analysis of Land Treatment of Municipal Wastewaters,
W75-04047 5D

COST-BENEFIT ANALYSIS
Some Political and Economic Aspects of Managing California Water Districts,
W75-03856 6B

Thermal Pollution of the Great Lakes -- A Non-Problem,
W75-04231 5B

Sensitivity Analysis of the Optimum Design Flood Evaluated by an Optimization Procedure,
W75-04234 4A

The Measurement of Impacts in Small Watersheds for Flood Control,
W75-04341 4A

COST COMPARISONS
Economic Analysis of Land Treatment of Municipal Wastewaters,
W75-04047 5D

Philadelphia Pilots--Builds Oxygen Activated Sludge,
W75-04115 5D

COSTS
Functional Plan for Water Supply and Waste Water Disposal for the Santee-Wateree Planning District,
W75-04195 5G

Cost of Importing Deep Sandstone Water to Eliminate Groundwater Deficits in Northeastern Illinois,
W75-04305 6C

COTTON
The Influence of Soil Salinity Upon Fruiting and Shedding, Boll Characteristics, Fiber Quality, and Yields of Two Cotton Species,
W75-04134 3C

Effect of Tractor Traffic, Surface Mulch and Seedbed Configuration on Soil Properties,
W75-04316 3F

REEKSHEDS
Protecting Creeksheds, Analysis and Action,
W75-03948 4D

REST-STAGE GAGES
Crest-Stage Gaging Stations in Oregon--A Compilation of Peak Data Collected from October 1952 to September 1974,
W75-03969 7C

ROP MANAGEMENT
Cropping Patterns Involving Rice and Their Management,
W75-04127 3F

ROP PRODUCTION
Some Socio-Agricultural Changes as a Result of Introduction of Irrigation in a Desert Region,
W75-03951 3F

Agronomic Survey of Jojoba in California,
W75-03960 3F

Some Considerations on Plant Types for Dry-and Agriculture,
W75-04126 2I

Studies of Tillage-Fertility on Pearl Millet in Sandy Arid Plains of Rajasthan,
W75-04129 3F

Effect of Moisture Regimes and Green Manuring on Ferrous Iron Concentration in Soil and Growth and Yield of Paddy,
W75-04318 3F

Isolated Soil Columns for Plant Research: Procedure and Uniformity Trial,
W75-04321 3F

Effect of Nitrate and Sediment Constraints on Economically Optimal Clay Production,
W75-04349 4D

LTIVATION
Studies of Tillage-Fertility on Pearl Millet in andy Arid Plains of Rajasthan,
W75-04129 3F

RRENTS (WATER)
Computation of Tides, Currents, and Dispersal f Pollutants in the New York Bight from lock Island to Atlantic City with Large Grid ize, Single and Two-Layer Hydrodynamical-Numerical Models, Part 4,
W75-04262 5B

RVES
lassical Canal Theory with Graphs and Tables. Volume II,
W75-04270 8B

ANEA
nhancement of Recreational Uses of stuarine Waters Through Study of Potential ontrol Methods for Stinging Sea Nettles,
W75-04037 5C

ANOPHYTA
itrogen Fixation By Blue-Green Algae-Lichen rusts in the Great Basin Desert,
W75-03963 5B

GON
oxicity of Zinc and Cygon, Applied Singly d Jointly, to Zebrafish Embryos,
W75-04282 5C

CZECHOSLOVAKIA
Use and Disposal of Solid Wastes From Pulp and Paper Production (Vyuzitie a likvidacia pevnych odpadov z vyroby buniciny a papiera),
W75-03886 5D

DAM CONSTRUCTION
Dam Building System,
W75-03873 8A

DAMS
Dam Building System,
W75-03873 8A

Ford Motor Co. V. Dallas Power and Light Co. (Action for Property Damage Resulting from Release of Waters from Dam During Time of Flooding).
W75-04297 6E

DATA ANALYSIS
Objective Double-Mass Analysis,
W75-04307 2B

DATA COLLECTIONS
Evaluation of Interregional Input-Output Models for Potential Use in the McClellan-Kerr Arkansas River Multiple Purpose Project Impact Study,
W75-03923 4A

Lakes of Oregon: Volume 2. Benton, Lincoln, and Polk Counties,
W75-03968 2H

Preconstruction Assessment of Biological Quality of the Chena and Little Chena Rivers in the Vicinity of Chena Lakes Flood Control Project Near Fairbanks, Alaska,
W75-03988 5B

Characteristics and Prediction of Soil Erosion on a Watershed in the Palouse,

DISSOLVED SOLIDS
Monitor for the Quality of Australia's Water Resources,
W75-03939 5A

The Morphoedaphic Index, A Fish Yield Estimator--Review and Evaluation,
W75-04116 5C

DISTILLATION
Milti-Stage Flash Evaporator,
W75-03860 3A

Apparatus for Solar Distillation,
W75-03876 3A

Hot Ball Desalination Process,
W75-03878 3A

Calculation of Fractionation Effects in Atmospheric Nuclear Bursts,
W75-04068 5B

DISTRIBUTION
Vertical Distribution of the Concentration of Radon Decay Products in the 0-300-m Layer,
W75-04106 5F

Population Exposure to Natural Radiation Background in Puerto Rico,
W75-04160 5F

A Review of Effluents, General Population Doses, and Occupational Doses Resulting from Commonwealth Edison's Use of Nuclear Power,
W75-04164 5F

DISTRIBUTION PATTERNS
Worldwide Distributions of Mean Monthly Dewpoint,
W75-04130 2A

Condos-A Model and Computer Code to Estimate Population and Individual Radiation Doses to Man From the Distribution, Use and Disposal of Consumer Products That Contain Radioactive Materials,
W75-04182 5B

CRE: A Method for Solving Probability Problems Related to Hydrologic Time Series,
W75-04310 2E

DITCHES
Two-Dimensional Displacement Into or from Water-Filled Ditches,
W75-03957 4A

DIVERSION STRUCTURES
Water Quality Aspects of the 1973 Opening of the Mississippi River Diversion Spillway at Bonnet Carre, Louisiana, U.S.A.,
W75-04256 5B

DOMESTIC USE
Attitudes Toward Payment for Resource Use: The Case of Domestic Water Consumption,
W75-04201 6C

DOMESTIC WASTES
Rejuvenation of the Buffalo River,
W75-04248 5C

DOMESTIC WATER
Attitudes Toward Payment for Resource Use: The Case of Domestic Water Consumption,
W75-04201 6C

DOSE
The Use and Misuse of Population Exposures in Radiation Protection,
W75-04154 5C

Data Needs for the Assessment of Population Dose From Background Radiation,
W75-04156 5A

Measurement of Absorbed Fractions For Photon Sources Distributed Uniformly in Various Organs of a Heterogeneous Phantom,
W75-04173 5A

DOSE CALCULATIONS
Decay Scheme Data for Radiation Dose Calculations,
W75-04174 5A

DOSE COMMITMENT
The Historical Development of Concepts of Radiation Dose Commitment,
W75-04153 5C

DOSE RATE
Environmental Radiation Measurements Using in Situ and Core Sampling Techniques,
W75-04159 5A

Age Factors for Dose Rates From an Infinite Cloud of a Photon Emitter,
W75-04176 5C

DOSE RATES
Population Exposure to Natural Terrestrial Gamma Radiation Around Selected Nuclear Power Plant Sites,
W75-04193 5A

DOSES
The Use of Environmental Monitoring Data in Determining Background Radiation Doses,
W75-04158 5A

Large Scale Nuclear Gas Stimulation: Population Doses Estimated in the Environmental Assessment of Carbon-14 Releases,
W75-04186 5A

DOSIMETERS
Field Testing of TSEE Dosimeters for Personnel Monitoring,
W75-04179 5A

DOSIMETRY
Low Level Population Exposure Measurements Using Thermoluminescent Dosimeters,
W75-04178 5A

Field Testing of TSEE Dosimeters for Personnel Monitoring,
W75-04179 5A

DOUBLE BRIDGES CREEK
Flood Plain Information: Choctawhatchee River, Pea River, Double Bridges Creek, City of Geneva, Alabama.
W75-04212 4A

DOUBLE TRIANGLE HYDROGRAPH
A Double-Triangle Model for Generating Storm Hydrographs,
W75-04241 4A

DRAINAGE WATER
Two-Dimensional Displacement Into or from Water-Filled Ditches,
W75-03957 4A

DRAINS
Rise and Decline of the Water Table Induced by Vertical Recharge,
W75-04333 2F

DREDGING
Disposal of Polluted Dredgings from the Great Lakes Area,
W75-04251 5B

Regional Landfill and Construction Material Needs in Terms of Dredged Material Characteristics and Availability; Volume I: Main Text,
W75-04266 5G

DRIFTING (AQUATIC)
A Drift Card Study in Monterey Bay, California: September 1971 to April 1973,
W75-04279 2L

DRIP IRRIGATION
The Effect of Various Rates of Semicontinuous Drip Irrigation on Lettuce, (Lactuca Sativa L.) Grown in Greenhouse,
W75-04146 2I

DROUGHT RESISTANCE
Agronomic Survey of Jojoba in California,
W75-03960 3F

Some Considerations on Plant Types for Dryland Agriculture,
W75-04126 2I

DROUGHT RESISTANCE (PLANTS)
Effects of CCC on Drought Resistance of Triticum Aestivum L and Zea Mays L,
W75-04011 3F

DROUGHT TOLERANCE
Effects of Low Water Potentials on Transpiration and Photosynthesis in Mitchell Grass (Astrebla Lappacea),
W75-03938 2D

A Field Study of the Heat and Drought Tolerance of Grain Sorghum (Sorghum Bicolor (L.) Moench) as an Approach to Genetic Improvement,
W75-04044 2I

DRY LAND FARMING
Preliminary Study on Movement of Available Water in Sandy Loam Soils Under Dry Farming Conditions,
W75-04133 3F

DRY-TYPE COOLING TOWER
Dry-Type Cooling Systems in Electric Power Production,
W75-04221 5D

DRYING
The Three Stages of Drying A Field Soil,
W75-03965 2D

DRYLAND FARMING
Effect of Stored Soil Moisture Reserve Through Conservation Practices and Supplemental Irrigation on Wheat Yield Under Dryland Farming Condition,
W75-04346 3F

DUAL SUPPLY SYSTEM
Planned Reuse of Polluted Waters and Wastewaters,
W75-04198 5D

DUNE SANDS
Dune Sand Stabilization with Synthetic Soil Conditioners: A Laboratory Experiment,
W75-03953 2G

DYE DITCH (MISS)
Special Flood Hazard Information Report: Yockanookany River, Dye Ditch and Munson Creek, Kosciusko, Attala County, Mississippi.
W75-04204 4A

DYNAMIC PROGRAMMING
Design of a Conduit System with Diverging Branches,
W75-03930 8A

Chance-Constrained Dynamic Programing and the Optimization of Water Resource Systems,
W75-03934 4A

Optimization of Real Time Operation of a Multiple-Reservoir System,
W75-03935 4A

EARTH RESOURCES TECHNOLOGY SATELLITE (ERTS-1) WILDFIRE
Usefulness of ERTS-1 and Supporting Aircraft Data for Monitoring Plant Development and Range Conditions in California's Annual Grassland,
W75-03990 4A

EASEMENTS
United States v. 21.54 Acres of Land, Marshall County, West Virginia (Condemnation Case for Flowage Easements Near Dam Site).
W75-03993 6E

Conservation and Flooding Easements: A Case Study,
W75-04211 6E

ECONOMIC IMPACT
The Measurement of Impacts in Small Watersheds for Flood Control,
W75-04341 4A

ECONOMIC JUSTIFICATION
The Measurement of Impacts in Small Watersheds for Flood Control,
W75-04341 4A

ECONOMIC PREDICTION
Water Resources Evaluation of the Southern High Plains of New Mexico,
W75-04042 4B

ECONOMICS
Cooling Towers - Best Achievable Thermal Pollution Abatement Technology,
W75-04223 5D

Cost of Importing Deep Sandstone Water to Eliminate Groundwater Deficits in Northeastern Illinois,
W75-04305 6C

ECOSYSTEMS
Some Biological Aspects of Aquatic Thermal Discharges,
W75-04225 5C

EFFICIENCIES
Effectiveness of the Pre-Aerator (Effektivnost' raboty pre-aeratora),
W75-03905 5D

EFFLUENT CONTROL
The Toxicities of Sewage Effluents, Industrial Discharges and Some Chemical Substances to Brown Trout (Salmo Trutta) in the Trent River Authority Area,
W75-04110 5C

EFFLUENT LIMITATIONS
Freeman Coal Mining Corp. V. Illinois Pollution Control Board (Appeal from of Pollution Control Board Holding That Defendant Made Illegal Discharges).
W75-04295 6E

EFFLUENTS
As Low as Practicable: A Critical Appraisal of Population Health Risks from Power Plant Effluents,
W75-04163 5A

A Review of Effluents, General Population Doses, and Occupational Doses Resulting from Commonwealth Edison's Use of Nuclear Power,
W75-04164 5B

Population Exposure Estimates as Derived from an Environmental Assessment of LWR Fuel Cycle Facilities, Part II: Long-Term Population Doses Following Cessation of Plant Operations,
W75-04167 5B

Determination of Gamma-Ray Exposure in the Vicinity of a Boiling Water Power Reactor,
W75-04168 5A

Projections of Radioactive Wastes from the Nuclear Fuel Cycle,
W75-04169 5B

Effect of Stack Height on Individual and Population Doses Attributable to Gaseous Effluents from a Model Fuel Reprocessing Facility,
W75-04170 5A

C-14 Gaseous Effluent From Pressurized Water Reactors,
W75-04171 5A

The Effect of Deposition Velocities on Estimates of Environmental Transport and Population Doses,
W75-04177 5A

Low Level Population Exposure Measurements Using Thermoluminescent Dosimeters,
W75-04178 5A

Health Effects of Fossil Fuel Power Plants,
W75-04180 5C

Comparative Population Radiation Dose Commitments of Nuclear and Fossil Fuel Electric Power Cycles,
W75-04181 5C

An Examination of Design Parameters in a Field Study for Exposure Evaluation,
W75-04192 5A

Population Exposure to Natural Terrestrial Gamma Radiation Around Selected Nuclear Power Plant Sites,
W75-04193 5A

Mechanics of Dispersion of Pollutants in Coastal Environment,
W75-04237 5B

Investigation for the Marine Disposal of Effluents,
W75-04289 5B

Treatment of Crude Sewage in Two High-Rate Activated-Sludge Plants Operated in Series,
W75-04334 5D

EL PASO (TEX)
Quality and Availability of Water in Westernmost Texas,
W75-03979 2K

ELECTRIC ANALOG MODELS
Application of Analog Techniques to Water Management,
W75-04202 6A

ELECTRIC POWER
Biomedical Evaluation of Low Frequency (Long Wave) Electromagnetic Radiation Associated with Electric Power Transmission,
W75-04191 5C

ELECTRIC POWER PRODUCTION
Comparative Population Radiation Dose Commitments of Nuclear and Fossil Fuel Electric Power Cycles,
W75-04181 5C

ELECTRIC POWERPLANTS
Health Effects of Fossil Fuel Power Plants,
W75-04180 5C

ELECTRICAL CONDUCTANCE
Monitor for the Quality of Australia's Water Resources,
W75-03939 5A

ELECTRO-KINETICS
Effects of Natural Microbial Preparations on the Electrokinetic Potential of Bacterial Cells and Clay Minerals,
W75-04317 5B

ELECTRODES
Determination of Parts Per Billion Sulfide in Water with the Sulfide-Selective Electrode,
W75-04021 5A

ELKHORN RIVER SUBBASIN (NEB)
Elkhorn River Basin Screening Model, A Report to the Missouri River Basin Commission,
W75-03921 6A

EMANATION
Assessment of Radon Emanation from the Surface of Extensive Territories,
W75-04090 5B

EMBRYONIC GROWTH STAGE
Toxicity of Zinc and Cygon, Applied Singly and Jointly, to Zebrafish Embryos,
W75-04282 5C

EMINENT DOMAIN
United States v. 21.54 Acres of Land, Marshall County, West Virginia (Condemnation Case for Flowage Easements Near Dam Site).
W75-03993 6E

ENERGY
Symposium on Population Exposures,
W75-04152 5C

ENERGY BUDGET
An Energy Partition Evaporation Recorder,
W75-03937 2D

Design of Thermal Cooling Systems Using the Cascade of Energy Concept,
W75-04228 5D

ENERGY CASCADE SYSTEMS
Design of Thermal Cooling Systems Using the Cascade of Energy Concept,
W75-04228 5D

ENERGY TRANSFER
Irreversible Thermodynamic Concept on Hydrogeochemical Transport Systems,
W75-04041 5B

Design of Thermal Cooling Systems Using the Cascade of Energy Concept,
W75-04228 5D

ENVIRONMENT
A Simple Two-Dimensional Analyzer of Beta-Gamma Coincidences in the Study of Radioactive Fallout Samples,
W75-04097 5A

The Use and Misuse of Population Exposures in Radiation Protection,
W75-04154 5C

Environmental Radiation Measurements Using in Situ and Core Sampling Techniques,
W75-04159 5A

Population Exposure Estimates as Derived from an Environmental Assessment of LWR Fuel Cycle Facilities. Part I: Population Doses from Operating Facilities,
W75-04166 5B

Population Exposure Estimates as Derived from an Environmental Assessment of LWR Fuel Cycle Facilities, Part II: Long-Term Population Doses Following Cessation of Plant Operations,
W75-04167 5B

The Effect of Deposition Velocities on Estimates of Environmental Transport and Population Doses,
W75-04177 5A

Health Effects of Fossil Fuel Power Plants,
W75-04180 5C

Water for the Human Environment, Volume IV, Special Sessions.
W75-04213 5B

ENVIRONMENTAL CONTROL
Guidelines for Preparation of Environmental Statements for Reviewing and Commenting on Environmental Statements by Other Federal Agencies.
W75-04010 6G

Progress in Satisfying Environmental Requirements,
W75-04018 5G

Is the Water Safe to Drink. Part 3: What You Can Do,
W75-04019 5F

A Positive Look at Achievements in Water Quality Enhancement,
W75-04247 5G

ENVIRONMENTAL EFFECTS
Pollution Potential of Aquatic Sediments,
W75-04150 5B

Thermal Pollution Problems in Poland,
W75-04218 5C

Run-Off Regulation of the St. Lawrence and Its Liability,
W75-04243 4A

Biological Processes Involved in Pollution of Coastal Aquaculture Waters,
W75-04281 5C

Senate Subcommittee Hears Complaints on EPA Water Programs.
W75-04302 5G

ENVIRONMENTAL IMPACT STATEMENTS
Guidelines for Preparation of Environmental Statements for Reviewing and Commenting on Environmental Statements by Other Federal Agencies.
W75-04010 6G

ENVIRONMENTAL POLICY
Guidelines for Preparation of Environmental Statements for Reviewing and Commenting on Environmental Statements by Other Federal Agencies.
W75-04010 6G

Non-Transportation Oil Spill Regulations.
W75-04303 5G

ENVIRONMENTAL SANITATION
Senate Subcommittee Hears Complaints on EPA Water Programs.
W75-04302 5G

ENVIRONMENTAL STANDARDS
Consideration of Background in Development of Environmental Standards,
W75-04155 5G

ENZYMES
Improved Clarification of Book Mill Effluent,
W75-03902 5D

EPHEMERAL STREAMS
The Hydraulic Geometry of a Discontinuous Ephemeral Stream in a Bajada Near Tucson, Arizona,
W75-04125 2E

EQUITABLE APPORTIONMENT
Wineman v. Shannon Brothers Lumber Co., Inc. (Action Between Coterminous Riparian Landowners to Determine Accretion Apportionment).
W75-03994 6E

EROSION
Characteristics and Prediction of Soil Erosion on a Watershed in the Palouse,
W75-04033 2J

EROSION CONTROL
Dune Sand Stabilization with Synthetic Soil Conditioners: A Laboratory Experiment,
W75-03953 2G

ESTIMATING EQUATIONS
The Nonlinear Rainfall Response of Watersheds With Time Dependent Storage and Conveyance Properties,
W75-04240 2A

A Set of Regime Equations For Indirectly Estimating Stream Flow Characteristics,
W75-04245 2E

Methods for Estimating Transport Model Parameters for Regional Groundwater Systems,
W75-04271 2F

ESTUARIES
Two-Dimensional Transient Hydro-Thermal Mathematical Model,
W75-04219 2H

Computation of Tides, Currents, and Dispersal of Pollutants in the New York Bight from Block Island to Atlantic City with Large Grid Size, Single and Two-Layer Hydrodynamical-Numerical Models, Part 4,
W75-04262 5B

Biological Processes Involved in Pollution of Coastal Aquaculture Waters,
W75-04281 5C

The Delaware Estuary System, Environmental Impacts and Socio-Economic Effects. Annex to Volume I. Management Agency Problems in the Delaware Estuary,
W75-04328 6F

ESTUARINE ENVIRONMENT
The Delaware Estuary System, Environmental Impacts and Socio-Economic Effects. Annex to Volume I. Management Agency Problems in the Delaware Estuary,
W75-04328 6F

ESTUARINE FISHERIES
The Thermal Requirements and Tolerances of Key Estuarine Organisms,
W75-03944 5C

ESTUARINE ORGANISMS
The Thermal Requirements and Tolerances of Key Estuarine Organisms,
W75-03944 5C

EUROPE
Thermal Pollution Aspects in Europe,
W75-04226 5B

EUROPIUM
Radioactive Isotopes of Europium Produced by Nuclear Blasts,
W75-04058 5A

EUTROPHICATION
Limnological Study of Lake Shastina, Siskiyou County, California,
W75-03982 2H

Natural Phosphate Removal Mechanisms in South Florida Lakes,
W75-04250 5G

The Eutrophication and Pollution of Lake Paijanne, Central Finland,
W75-04264 5C

Phytoplankton Enrichment Experiments and Bioassays in Natural Coastal Sea Water and in Sewage Outfall Receiving Waters Off Southern California,
W75-04283 5C

Effect of Turbidity on Algal Growth,
W75-04306 5C

EVALUATION
Evaluation of Interregional Input-Output Models for Potential Use in the McClellan-Kerr Arkansas River Multiple Purpose Project Impact Study,
W75-03923 4A

Evaluating Multireservoir Operating Rules,
W75-03932 4A

Water Resources Evaluation of the Southern High Plains of New Mexico,
W75-04042 4B

EVAPORATION
An Energy Partition Evaporation Recorder,
W75-03937 2D

The Three Stages of Drying A Field Soil,
W75-03965 2D

Relation of Soybean Leaf Water Potential to Soil Water Potential,
W75-03989 3F

Open Channel Flow Evaporation Study,
W75-04273 2D

EVAPORATORS
Milti-Stage Flash Evaporator,
W75-03860 3A

EVAPORIMETERS
An Energy Partition Evaporation Recorder,
W75-03937 2D

EXPERIMENTAL FARMS
A Demonstration of Waste Heat Use in Agriculture,
W75-04224 5D

FALLOUT
Nuclear Meteorology,
W75-04054 5B

Determination of Radioisotope Fallout From Its Content in Chronological Layers of High-Altitude Glaciers,
W75-04057 5A

Radioactive Isotopes of Europium Produced by Nuclear Blasts,
W75-04058 5A

Rate of Atmospheric Fallout of Cesium-137 and Strontium-90 Aerosols,
W75-04061 5A

Accumulation of Strontium-90 in Soils,
W75-04062 5B

Comparative Distribution of Strontium-90 and Cesium-137 in Different Types of Soils,
W75-04064 5B

FALLOUT

Distribution and Migration of Strontium-90 in Soils,
W75-04065 5B

State of Strontium-90, Cesium-137, and Cerium-144 in Radioactive Fallout,
W75-04071 5B

Comparison of the Characteristics of Hygroscopic and Non-Hygroscopic Aersol Washout by Cloud-Borne Drops,
W75-04075 5B

Atmospheric Washout of Radioactive Contaminant in the Mountains of Central Caucasus,
W75-04076 5B

Relation Between Atmospheric Precipitation Washout of Radio-Activity and Nonactive Ions,
W75-04079 5B

Long-Lived Alpha-Radioactivity in Fallout at Vilnius and at Various Atlantic Latitudes,
W75-04083 5A

Seasonal Beryllium-7 Variations in Ground Level Air,
W75-04084 5A

Concentration of Sodium Radioisotopes in the Ground Layer of the Atmosphere and in Precipitation,
W75-04085 5A

Concentration of Phosphorus Radioisotopes in the Ground Layers of the Atmosphere and in Precipitation,
W75-04086 5A

Radium-226 in Atmospheric Precipitation, and the Possibilities for Lead-210, Bismuth-210 and Polonium-210 to Penetrate the Atmosphere from the Earth's Surface,
W75-04087 5A

Separate Determination of Rn, RaA, RaB, and RaC Concentrations in Air from the Alpha-Activity Decay Curve of a Filter,
W75-04095 5A

Fallout and Accumulation of Radioactive Decay Products in 1966-1968 in the Vicinity of Leningrad,
W75-04103 5B

Penetration of Radioactive Fission Products from 1964-1967 Nuclear Tests into the Ground Layer of the Atmosphere in the Leningrad Area,
W75-04104 5B

Dosimetry of Internal Emitters for Population Exposure,
W75-04172 5C

FARM MANAGEMENT

The Development of Supplemental Water: Resource Flexibility and Farm Management Options,
W75-04031 3F

FARM WASTES

Effect of Moisture Regimes and Green Manuring on Ferrous Iron Concentration in Soil and Growth and Yield of Paddy,
W75-04318 3F

FEDERAL GOVERNMENT

WPCF Adopts Resolutions Aimed at Easing Problems of Water Law.
W75-04009 5G

Biderman V. Morton (Seeking Injunction to Restrain Construction on Fire Island Pending Environmental Impact Statement).
W75-04291 6E

Flood Plain Information: Gillies Creek, Henrico County, Virginia,
W75-04209 2E

FLOOD PLAINS
Special Flood Hazard Information Report: Yockanookany River, Dye Ditch and Munson Creek, Kosciusko, Attala County, Mississippi.
W75-04204 4A

Flood Plain Information: Jordan River Complex II, Midvale-Draper, Utah.
W75-04205 4A

FLOOD PROFILES
Flood Plain Information: North Run, Henrico County, Virginia,
W75-04208 2E

Flood Plain Information: Gillies Creek, Henrico County, Virginia,
W75-04209 2E

Flood Plain Information: Choctawhatchee River, Pea River, Double Bridges Creek, City of Geneva, Alabama.
W75-04212 4A

FLOOD PROTECTION
Special Flood Hazard Information Report: Yockanookany River, Dye Ditch and Munson Creek, Kosciusko, Attala County, Mississippi.
W75-04204 4A

Water Quality Aspects of the 1973 Opening of the Mississippi River Diversion Spillway at Bonnet Carre, Louisiana, U.S.A.,
W75-04256 5B

FLOOD ROUTING
Water Quality Aspects of the 1973 Opening of the Mississippi River Diversion Spillway at Bonnet Carre, Louisiana, U.S.A.,
W75-04256 5B

FLOODED SOILS
Sulfate Reduction and Sulfide Oxidation in Flooded Soil as Affected by Chemical Oxidants,
W75-04347 5B

Conversion of DDT to DDD in Flooded Soil,
W75-04348 5B

FLOODING
Special Flood Hazard Information Report: Yockanookany River, Dye Ditch and Munson Creek, Kosciusko, Attala County, Mississippi.
W75-04204 4A

FLOODING REDUCTION
Use of Black Polyethylene Mulch to Reduce Flooding Effects on Tomato Yields,
W75-04030 3F

FLOODPLAIN ZONING
Flood Plain Information: Choctawhatchee River, Pea River, Double Bridges Creek, City of Geneva, Alabama.
W75-04212 4A

FLOODS
Flood-Hazard Study--100-Year Flood Stage for Baldwin Lake, San Bernardino County, California,
W75-03981 2H

Special Flood Hazard Information Report: Yockanookany River, Dye Ditch and Munson Creek, Kosciusko, Attala County, Mississippi.
W75-04204 4A

FLORIDA
The Observation-Well Network of the U.S. Geological Survey in Florida,
W75-03971 7C

Hydrologic Data for 1973, Broward County, Florida,
W75-03976 3B

United States v. Holland (Action to Enjoin Unlawful Filling Operations).
W75-04005 6E

Natural Phosphate Removal Mechanisms in South Florida Lakes,
W75-04250 5G

FLOTATION
On the Application of Polyelectrolytes to White Water Treating by Dissolved-Air Flotation (In Japanese),
W75-03884 5D

Microflotation, New-Old Water Purification Technique (Mikroflotation, nygammal vattenreningsteknik),
W75-03888 5D

FLOTATION METHOD
A Flotation Method for the Rapid Measurement of the Wet Bulk Density of Soil Clods,
W75-04135 2G

FLOW
The Ultrasonic Method of River Gauging,
W75-04026 4A

Analytical Model for a Heated Submerged Discharge into Break Water Wall Area,
W75-04214 2H

FLOW AUGMENTATION
Evaluating Multireservoir Operating Rules,
W75-03932 4A

FLOW CHARACTERISTICS
Two-Dimensional Displacement Into or from Water-Filled Ditches,
W75-03957 4A

FLOW RESISTANCE
Study of the Resistance of Fibrous Filtering Materials in Rarefied Air,
W75-04105 5A

FLUORESCENCE
Phytoplankton Enrichment Experiments and Bioassays in Natural Coastal Sea Water and in Sewage Outfall Receiving Waters Off Southern California,
W75-04283 5C

FLUORIDE
Further Observations on Endemic Fluoride-Induced Osteopathies in Children,
W75-03909 5C

FLUOROSIS (SKELETAL)
Further Observations on Endemic Fluoride-Induced Osteopathies in Children,
W75-03909 5C

FOOD CHAINS
Dosimetry of Internal Emitters for Population Exposure,
W75-04172 5C

A Metabolic Model for Whole Body and GI Tract Retention in a Human Infant Deduced from Experimental Data on Suckling Rats Administered a Single Oral Dose of Cerium-141 at Different Ages,
W75-04175 5C

FORECASTING
Prediction of Radioisotope Concentrations in Freshwater Streams,
W75-03852 5B

Characteristics and Prediction of Soil Erosion on a Watershed in the Palouse,
W75-04033 2J

Cooling Pond Temperature Prediction,
W75-04222 5B

FOREST WATERSHEDS
More Streamflow After a Bark Beetle Epidemic,
W75-04342 4C

FORESTRY
Vegetation Management for Increased Water Yield in Arizona,
W75-03961 3B

FORMALDEHYDE
An Automated Method for the Determination of Formaldehyde in Sewage and Sewage Effluents,
W75-04112 5A

FOSSIL FUELS
Health Effects of Fossil Fuel Power Plants,
W75-04180 5C

Comparative Population Radiation Dose Commitments of Nuclear and Fossil Fuel Electric Power Cycles,
W75-04181 5C

FOX RIVER (ILL)
Effect of Turbidity on Algal Growth,
W75-04306 5C

FROUDE NUMBER
Design and Model Tests of Thermal Discharge Diffusers,
W75-04216 8B

FUEL CYCLE
Comparative Population Radiation Dose Commitments of Nuclear and Fossil Fuel Electric Power Cycles,
W75-04181 5C

FUELS
Population Exposure Estimates as Derived from an Environmental Assessment of LWR Fuel Cycle Facilities. Part I: Population Doses from Operating Facilities,
W75-04166 5B

Population Exposure Estimates as Derived from an Environmental Assessment of LWR Fuel Cycle Facilities, Part II: Long-Term Population Doses Following Cessation of Plant Operations,
W75-04167 5B

Irradiated Fuel and Control Rods Transport from a Decommissioned Power Reactor,
W75-04188 5E

FURROW IRRIGATION
Evaluation of Irrigation Systems in the Snake River Fan, Jefferson County, Idaho,
W75-04032 3F

FURROWS
Evaluation of Irrigation Systems in the Snake River Fan, Jefferson County, Idaho,
W75-04032 3F

FWPCA AMENDMENTS OF 1972
Senate Subcommittee Hears Complaints on EPA Water Programs.
W75-04302 5G

GAGING STATIONS
Objective Double-Mass Analysis,
W75-04307 2B

GAMMA RADIATION
Plant for Treating Water, in Particular Sewage or Sludge,
W75-03862 5D

GAMMA RAYS
A Gamma Transmission Method for the Determination of Moisture Content in Soils,
W75-04343 2G

GAMMA TRANSMISSION METHOD
A Gamma Transmission Method for the Determination of Moisture Content in Soils,
W75-04343 2G

GAS CHROMATOGRAPHY
Direct Analysis of Water Samples for Organic Pollutants With Gas Chromatography/Mass Spectrometry,
W75-03910 5A

GASES
Effect of Stack Height on Individual and Population Doses Attributable to Gaseous Effluents from a Model Fuel Reprocessing Facility,
W75-04170 5A

C-14 Gaseous Effluent From Pressurized Water Reactors,
W75-04171 5A

Estimation of the Dose Equivalent to the U.S. Population from Radon in Liquified Petroleum Gas,
W75-04184 5A

Radiation Dose From Natural Gas vs. That From Nuclear Stimulated Natural Gas,
W75-04185 5A

GENEVA (ALA)
Flood Plain Information: Choctawhatchee River, Pea River, Double Bridges Creek, City of Geneva, Alabama.
W75-04212 4A

GEOCHEMISTRY
The Comparative Marine Geochemistries of Lead 210 and Radium 226,
W75-04029 5B

GEOGRAPHICAL REGIONS
Population Exposure to Natural Radiation Background in Puerto Rico,
W75-04160 5B

GEORGIA
Use of Water in Georgia, 1970, with Projections to 1990,
W75-03983 6D

Geology and Ground-Water Resources of Gordon, Whitfield, and Murray Counties, Georgia,
W75-03984 2F

GEOTHERMAL STUDIES
Special Techniques for Determining Chemical Properties of Geothermal Water,
W75-03980 2K

GILLIES CREEK (VIRGINIA)
Flood Plain Information: Gillies Creek, Henrico County, Virginia,
W75-04209 2E

GLACIERS
Determination of Radioisotope Fallout From Its Content in Chronological Layers of High-Altitude Glaciers,
W75-04057 5A

GOVERNMENTAL INTERRELATIONS
Scattering Fork Drainage District, County of Douglas v. Ogilvie (Suit Challenging Legality of Proposed Consruction of Water Reservoir Project)
W75-04008 6E

GRAIN SORGHUM
A Field Study of the Heat and Drought Tolerance of Grain Sorghum (Sorghum Bicolor (L.) Moench) as an Approach to Genetic Improvement,
W75-04044 2I

GRASSES
The Effect of Interval and Intensity of Defoliation on the Dry Matter Production of Some Important Grass Species of Western Rajasthan,
W75-04131 2I

GRASSLANDS
Usefulness of ERTS-1 and Supporting Aircraft Data for Monitoring Plant Development and Range Conditions in California's Annual Grassland,
W75-03990 4A

GRAVITY SEPARATION
Apparatus and Method for Effecting Separations,
W75-03872 5G

GRAVITY WAVES
Ambient Current Effects on Vertical Selective Withdrawal in a Two Layer System,
W75-04049 4A

GREAT LAKES
A Summary and Comparison of Nutrients and Related Water Quality in Lakes Erie, Ontario, Huron, and Superior,
W75-04027 5B

Thermal Pollution of the Great Lakes -- A Non-Problem,
W75-04231 5B

Disposal of Polluted Dredgings from the Great Lakes Area,
W75-04251 5B

GROUND WATER
Application of Analog Techniques to Water Management,
W75-04202 6A

GROUND WATER AVAILABILITY
Application of Analog Techniques to Water Management,
W75-04202 6A

GROUNDWATER
Stochastic Models for the Interaction of Rainfall and Groundwater Levels,
W75-03949 2A

Possible Development of Water from Madison Group and Associated Rock in Powder River Basin, Montana-Wyoming,
W75-03972 4B

Hydrologic Data for 1973, Broward County, Florida,
W75-03976 3B

Water-Resources Investigations of the U.S. Geological Survey in the Northern Great Plains Coal Region of Eastern Montana, 1974-75.
W75-03977 7C

Quality and Availability of Water in Westernmost Texas,
W75-03979 2K

Geology and Ground-Water Resources of Gordon, Whitfield, and Murray Counties, Georgia,
W75-03984 2F

Solid Waste and Water Quality, (Literature Review),
W75-04016 5B

Solid Waste Disposal by Land Burial in Southern Indiana,
W75-04035 5B

Degradation in Groundwater and Mobility of Herbicides,
W75-04045 5B

Hydrogeology of the Carefree Ranch Area, Maricopa County, Arizona,
W75-04145 2F

Cost of Importing Deep Sandstone Water to Eliminate Groundwater Deficits in Northeastern Illinois,
W75-04305 6C

ROUNDWATER MANAGEMENT
Integrated System Identification and Optimization for Conjunctive Use of Ground and Surface Water, Phase II,
W75-03853 4B

ROUNDWATER MOVEMENT
Geohydrologic Map of Southern California,
W75-03973 7C

Irreversible Thermodynamic Concept on Hydrogeochemical Transport Systems,
W75-04041 5B

Methods for Estimating Transport Model Parameters for Regional Groundwater Systems,
W75-04271 2F

Second-Order Theory of Flow in Three-Dimensional Deforming Media,
W75-04308 2F

The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

Rise and Decline of the Water Table Induced by Vertical Recharge,
W75-04333 2F

Models of Dispersion in a Granular Medium,
W75-04340 2F

GROUNDWATER POTENTIAL
Hydrogeology of the Carefree Ranch Area, Maricopa County, Arizona,
W75-04145 2F

GROUNDWATER RECHARGE
Stochastic Models for the Interaction of Rainfall and Groundwater Levels,
W75-03949 2A

GROUNDWATER RESOURCES
Identification of a Distributed Parameter System in Hydrology,
W75-04280 2F

GROWTH RATE
Biological Processes Involved in Pollution of Coastal Aquaculture Waters,
W75-04281 5C

GROWTH RATES
Interactions Between Light and Carbon Dioxide Availabilities as a Control of Algal Species Succession,
W75-04148 5C

GULF OF CALIFORNIA
The Comparative Marine Geochemistries of Lead 210 and Radium 226,
W75-04029 5B

GUPPIES
The Toxicity of 2, 3, 7, 8-Tetrachlorodibenzo-P-Dioxin (TCDD) in Guppies (Poecilia Reticulatus Peters),
W75-04028 5C

HAIL
General Disposition and Aquatic Environmental Effects of Silver Iodide in Precipitation Management,
W75-04255 3B

HARBORS
Stopping Distances of V.L.C.C. in IJmuiden,
W75-03925 8B

Experiences with Tidal Salinity Model Europoort,
W75-03927 8B

HARMONIC LINEAR WAVES
Linear Wave Propagation Problems and the Finite Element Method,
W75-03926 8B

HAWAII
Aquatic Survey of the Kona Coast Ponds, Hawaii Island,
W75-04275 2L

HAZARDOUS SUBSTANCES
Reserve Mining Co. Et. Al. V. United States (Motion for Stay of Injunction).
W75-04296 6E

HAZARDOUS SUBSTANCES (POLLUTION)
United States v. Republic Steel Corporation (Prosecution for Unlawful Discharge of Coal Tar into a River).
W75-03992 5G

HAZARDS
Exposures to Five Target Health Hazards,
W75-04190 5A

Biomedical Evaluation of Low Frequency (Long Wave) Electromagnetic Radiation Associated with Electric Power Transmission,
W75-04191 5C

HEAT BALANCE
Heat Dissipation from Turbulent Open Channel Flow,
W75-04350 5B

HEAT EXCHANGERS
Milti-Stage Flash Evaporator,
W75-03860 3A

HEAT FLOW
Heat Dissipation from Turbulent Open Channel Flow,
W75-04350 5B

HEAT LOSS
Heat Dissipation from Turbulent Open Channel Flow,
W75-04350 5B

HEAT TOLERANCE (PLANTS)
A Field Study of the Heat and Drought Tolerance of Grain Sorghum (Sorghum Bicolor (L.) Moench) as an Approach to Genetic Improvement,
W75-04044 2I

HEATED SUBMERGED DISCHARGE
Analytical Model for a Heated Submerged Discharge into Break Water Wall Area,
W75-04214 2H

HEATED WATER
Putting the Sun to Work: A History and Directory of Currently Available Solar Energy Applications,
W75-04128 3A

Analytical Model for a Heated Submerged Discharge into Break Water Wall Area,
W75-04214 2H

Some Results from Experimental Data on Surface Jet Discharge of Heated Water,
W75-04220 5B

A Demonstration of Waste Heat Use in Agriculture,
W75-04224 5D

Some Biological Aspects of Aquatic Thermal Discharges,
W75-04225 5C

A Combined System Concept for Power Generation and Wastewater Renovation,
W75-04227 5D

Review of Heated Surface Discharge Models Applicable to Rivers,
W75-04229 5B

Mathematical Modelling and Identification of Thermal Pollution in Streams: A Review Paper,
W75-04230 5B

Development of a Complete Mathematical Model for Describing the Point Beach Nuclear Power Plant Thermal Plume,
W75-04238 5B

HEAVY METALS
Kinetics of Microbiologically Mediated Transformations of Heavy Metals in Aquatic Environments,
W75-03945 5B

HECHLER VILLAGE BRANCH (VIRGINIA)
Flood Plain Information: Gillies Creek, Henrico County, Virginia,
W75-04209 2E

HELE-SHAW MODELS
The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

HENRICO COUNTY
Flood Plain Information: North Run, Henrico County, Virginia,
W75-04208 2E

HENRICO COUNTY (VIRGINIA)
Flood Plain Information: Gillies Creek, Henrico County, Virginia,
W75-04209 2E

HERBICIDES
The Toxicity of 2, 3, 7, 8-Tetrachlorodibenzo-P-Dioxin (TCDD) in Guppies (Poecilia Reticulatus Peters),
W75-04028 5C

Degradation in Groundwater and Mobility of Herbicides,
W75-04045 5B

HEXAVALENT CHROMIUM
New Spectrophotometric Method for the Estimation of Hexavalent Chromium in Water,
W75-04113 5A

HIGH PLAINS (N MEX)
Water Resources Evaluation of the Southern High Plains of New Mexico,
W75-04042 4B

HIGH WATER MARK
United States v. 21.54 Acres of Land, Marshall County, West Virginia (Condemnation Case for Flowage Easements Near Dam Site).
W75-03993 6E

HISTORIC FLOODS
Flood Plain Information: Choctawhatchee River, Pea River, Double Bridges Creek, City of Geneva, Alabama.
W75-04212 4A

HISTORY
The Story of Wonder, Churchill County, Nevada,
W75-03985 3E

Irrigation's Impact on Society.
W75-04138 3F

HUMAN ENVIRONMENT

United States V. Ira. S. Bushey and Sons, Inc. (Discharge of Refuse into Navigable Waters--Oil Spills),
W75-04300 6E

ROCKY BRANCH (VIRGINIA)
Flood Plain Information: North Run, Henrico County, Virginia,
W75-04208 2E

ROCKY MOUNTAIN REGION
Entrainment of Stratospheric Tritium: Another Radiological Anomaly of the Rocky Mountain West,
W75-04162 5A

ROOT ZONE
Preliminary Study on Movement of Available Water in Sandy Loam Soils Under Dry Farming Conditions,
W75-04133 3F

ROOTS
Corn Root-Configuration Response to Soil Temperature and Matric Suction,
W75-04288 3F

RUNOFF
Run-Off Regulation of the St. Lawrence and Its Liability,
W75-04243 4A

SAFE DRINKING WATER ACT
Water Reuse...Safe Drinking Act...How Soon...How Good.
W75-04322 5G

SAFE DRINKING WATER ACT OF 1973
National Drinking Water Standards.
W75-03998 5G

SAFETY
Consideration of Background in Development of Environmental Standards,
W75-04155 5G

Exposures During The Transportation of Radioactive Materials,
W75-04189 5C

SAGINAW BAY (MICH)
Saginaw Bay: An Evaluation of Existing and Historical Conditions,
W75-04278 5C

SALINE SOILS
Distribution of Boron in Salt Affected and Contiguous Normal Soils,
W75-04141 2G

SALINE WATER
Dichromate Relux Chemical Oxygen Demand: A Proposed Method for Chloride Correction in Highly Saline Wastes,
W75-04124 5A

Distribution of Boron in Salt Affected and Contiguous Normal Soils,
W75-04141 2G

SALINE WATER BARRIERS
Pneumatic Barriers to Reduce Salt Intrusion Through Locks,
W75-03920 8A

SALINE WATER-FRESHWATER INTERFACES
The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

SALINE WATER INTRUSION
Pneumatic Barriers to Reduce Salt Intrusion Through Locks,
W75-03920 8A

The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

SALINITY
The Influence of Soil Salinity Upon Fruiting and Shedding, Boll Characteristics, Fiber Quality, and Yields of Two Cotton Species,
W75-04134 3C

The Effect of Salinity on a Marine and a Freshwater Ascomycete,
W75-04267 5C

Marine Studies of San Pedro Bay, California, Part V; Data Report, Temperature, Salinity, Oxygen and Hydrogen Ion Concentration in outer Los Angeles Harbor, June 1971 to November 1973.
W75-04272 5B

SALMONIDS
Acute Toxicity of a Zinc-Polluted Stream to Four Species of Salmonids,
W75-04287 5C

SALT MARSHES
Additional Studies of the Effects of Salt Marsh Impoundments on Mosquito Populations,
W75-04048 5G

SAN FRANCISCO BAY AREA (CALIF)
Limnological Data from Selected Lakes in the San Francisco Bay Region, California,
W75-03975 2H

SAN JUAN MOUNTAINS (COLO)
General Disposition and Aquatic Environmental Effects of Silver Iodide in Precipitation Management,
W75-04255 3B

SANDS
Hydraulic and Flow Studies Related to Sediment Transport, Kentucky River, Kentucky,
W75-04147 2J

Temporary Body Burdens in Dose-Effect Studies of the Brazilian Areas of High Natural Radioactivity,
W75-04161 5C

SANDSTONES
Lysimeter Installations in Sandstone at Styrrup, Nottinghamshire,
W75-04332 2G

SANDY SOILS
Effect of Tractor Traffic, Surface Mulch and Seedbed Configuration on Soil Properties,
W75-04316 3F

SANTEE RIVER (SOCAR)
The Dilution Capacity of Small Streams in South Carolina,
W75-04050 5B

SASKATCHEWAN WATER RESOURCES
Control of Water Pollution: Miscellaneous Provisions.
W75-04323 5G

SATURATED FLOW
Two-Dimensional Displacement Into or from Water-Filled Ditches,
W75-03957 4A

SCENEDESMUS QUADRACAUDA
The Effect of Cadmium on Population Growth in the Green Alga Scenedesmus Quadracauda,
W75-04284 5C

SCHEDULING
Methodologies for Operating Reservoirs for Short-Term Flood Control,
W75-03855 4A

SCOTLAND
Water Pollution and Control,
W75-03915 5B

SCOUR
Hydraulic and Flow Studies Related to Sediment Transport, Kentucky River, Kentucky,
W75-04147 2J

SEA NETTLES
Enhancement of Recreational Uses of Estuarine Waters Through Study of Potential Control Methods for Stinging Sea Nettles,
W75-04037 5C

SEA WATER
Regional Water Supply Development Utilizing Brackish Water Resources in the Southern Arava Region,
W75-03962 3A

Radiochemical Method of Determining Low Strontium-90 Concentration Levels in Environmental Samples,
W75-04102 5A

Mechanics of Dispersion of Pollutants in Coastal Environment,
W75-04237 5B

Investigation for the Marine Disposal of Effluents,
W75-04289 5B

SEASONAL
Study of the Seasonal Effects on the Microbiology of a Northern Pulp and Paper Mill Aeration Lagoon,
W75-03916 5D

Spring and Fall Thermal Bar Development in Lake Superior,
W75-04038 5B

SECCHI DEPTH
A Summary and Comparison of Nutrients and Related Water Quality in Lakes Erie, Ontario, Huron, and Superior,
W75-04027 5B

SECONDARY RECOVERY (OIL)
Large Scale Nuclear Gas Stimulation: Population Doses Estimated in the Environmental Assessment of Carbon-14 Releases,
W75-04186 5A

Philosophy and Methodology of Assessment of Radiation Doses to Populations from Combustion Products of Plowshare Natural Gas,
W75-04187 5C

SEDIMENT DISTRIBUTION
Hydraulic and Flow Studies Related to Sediment Transport, Kentucky River, Kentucky,
W75-04147 2J

SEDIMENT TRANSPORT
Hydraulic and Flow Studies Related to Sediment Transport, Kentucky River, Kentucky,
W75-04147 2J

SEDIMENTS
Pollution Potential of Aquatic Sediments,
W75-04150 5B

Disposal of Polluted Dredgings from the Great Lakes Area,
W75-04251 5B

Effect of Nitrate and Sediment Constraints on Economically Optimal Clay Production,
W75-04349 4D

SEEDBED CONFIGURATION
Effect of Tractor Traffic, Surface Mulch and Seedbed Configuration on Soil Properties,
W75-04316 3F

SEEDS
Agronomic Survey of Jojoba in California,
W75-03960 3F

SEICHES
Classic Canal Theory with Graphs and Tables. Volume I,
W75-04269 8B

SELECTIVE WITHDRAWAL
Ambient Current Effects on Vertical Selective Withdrawal in a Two Layer System,
W75-04049 4A

SELENASTRUM CAPRICORNUTUM
A Continuous Flow Kinetic Model to Predict the Effects of Temperature on the Toxicity of Waste to Algae,
W75-04052 5C

SEMIARID CLIMATES
Agronomic Survey of Jojoba in California,
W75-03960 3F

Regional Water Supply Development Utilizing Brackish Water Resources in the Southern Arava Region,
W75-03962 3A

SEMIPERMEABLE MEMBRANES
Control of Reverse Osmosis Membrane Hydrolysis with Dynamically Formed Wood Chemical Membranes,
W75-03890 5D

SENSITIVITY ANALYSIS
Sensitivity Analysis of the Optimum Design Flood Evaluated by an Optimization Procedure,
W75-04234 4A

SEPARATION TECHNIQUES
Pumping Apparatus for Skimming and Recovering an Oil Layer from a Body of Water,
W75-03865 5G

Apparatus for Separating Solids from Liquids,
W75-03866 5D

Use of Sulfur for Combatting Oil Spills,
W75-03869 5G

Apparatus and Method for Effecting Separations,
W75-03872 5G

Selection of Coagulants for Treatment of Excess Activated Sludge (Vybor koagulyantov dlya obrabotki izbytochnogo aktivnogo ila),
W75-03894 5D

Solving Effluent Problems by the Use of Centrifuges,
W75-03942 5D

Filtration - Media Selection is the Key to Success.
W75-03943 5F

Filtration Engineering's Symposium on Membrane Separation.
W75-04122 5D

SETTLED DOMESTIC SEWAGE
Treatment of Crude Sewage in Two High-Rate Activated-Sludge Plants Operated in Series,
W75-04334 5D

SEVIER LAKE (UTAH)
Planning for Water Quality in the Sevier River System in the State of Utah: A Program for Developing a Comprehensive Water Quality Management Plan.
W75-04207 5G

SEVIER RIVER (UTAH)
Planning for Water Quality in the Sevier River System in the State of Utah: A Program for Developing a Comprehensive Water Quality Management Plan.
W75-04207 5G

SEWAGE
An Automated Method for the Determination of Formaldehyde in Sewage and Sewage Effluents,
W75-04112 5A

SEWAGE DISPOSAL
Investigation for the Marine Disposal of Effluents,
W75-04289 5B

SEWAGE EFFLUENTS
Hydrogen Peroxide Treatment of Effluent Resulting from Wet Air Oxidation of Shipboard Wastes,
W75-04261 5D

Phytoplankton Enrichment Experiments and Bioassays in Natural Coastal Sea Water and in Sewage Outfall Receiving Waters Off Southern California,
W75-04283 5C

SEWAGE SLUDGE DISPOSAL
Containing the Flow of Sewage Sludge.
W75-04336 5D

SEWAGE SYSTEMS
Functional Plan for Water Supply and Waste Water Disposal for the Santee-Wateree Planning District,
W75-04195 5G

SEWAGE TREATMENT
Oxygenation of Waste Water,
W75-03858 5D

Plant for Treating Water, in Particular Sewage or Sludge,
W75-03862 5D

Waste Water Treatment System,
W75-03879 5D

Selection of Coagulants for Treatment of Excess Activated Sludge (Vybor koagulyantov dlya obrabotki izbytochnogo aktivnogo ila),
W75-03894 5D

Phosphorus Detergent Ban-How Effective,
W75-04109 5D

Operational Aspects of Urban Sewage Works,
W75-04114 5D

Water and Sewer Management Study, Altamaha Georgia Southern Area.
W75-04196 5G

Hydrogen Peroxide Treatment of Effluent Resulting from Wet Air Oxidation of Shipboard Wastes,
W75-04261 5D

Treatment of Crude Sewage in Two High-Rate Activated-Sludge Plants Operated in Series,
W75-04334 5D

Containing the Flow of Sewage Sludge.
W75-04336 5D

Application of Micro-Controllers Melmic 100 to Water Treatment Facilities, (In Japanese),
W75-04338 5D

SEWERAGE
Operational Aspects of Urban Sewage Works,
W75-04114 5D

Water and Sewer Management Study, Altamaha Georgia Southern Area.
W75-04196 5G

SEWERS
Self-Cleaning Filter for Hydrological Regeneration,
W75-03864 5D

Water Sewer Plan and Program for the Youngstown-Warren Metropolitan Area,
W75-04200 5D

SHELLFISH FARMING
Marine Conservation Commission (As Amended).
W75-04004 6E

SHIPPING
Experiences with Tidal Salinity Model Europoort,
W75-03927 8B

SHIPS
Stopping Distances of V.L.C.C. in IJmuiden,
W75-03925 8B

SHORE PROTECTION
Method and Apparatus for Breaking Waves,
W75-03868 8B

Device for Producing and Protecting Deposits of Sedimentary Material on the Floor of Bodies of Water,
W75-03871 8B

SHRIMP
Effects of Phthalate Esters on Shrimp,
W75-04285 5C

SIERRA NEVADA MOUNTAINS
Project Skywater.
W75-04265 3B

SILVER IODIDE
General Disposition and Aquatic Environmental Effects of Silver Iodide in Precipitation Management,
W75-04255 3B

SIMULATION ANALYSIS
Laboratory Studies on Transverse Mixing in Rivers,
W75-03928 8B

Enhancing Water Resource Planning Effectiveness: A Simulation Gaming Approach,
W75-04233 6A

Identification of a Distributed Parameter System in Hydrology,
W75-04280 2F

SITES
Changing Water Use in Selected Manufacturing Industries,
W75-03922 6B

Assessment of Public Radiation Exposure in the Vicinity of U.S. Aec Sites,
W75-04194 5A

SKIMMING
Pumping Apparatus for Skimming and Recovering an Oil Layer from a Body of Water,
W75-03865 5G

Skimming Apparatus,
W75-03870 5G

SLUDGE
Use and Disposal of Solid Wastes From Pulp and Paper Production (Vyuzitie a likvidacia pevnych odpadov z vyroby buniciny a papiera),
W75-03886 5D

SLUDGE INCINERATION
Containing the Flow of Sewage Sludge.
W75-04336 5D

SLUDGE REMOVAL
An Overloaded Sludge Plant. Try Chemical Treatment,
W75-04123 5D

SLUDGE TREATMENT
Selection of Coagulants for Treatment of Excess Activated Sludge (Vybor koagulyantov dlya obrabotki izbytochnogo aktivnogo ila),
W75-03894 5D

Treatment of Residual Sludges: Generalities and Applications in the Paper Industry (Traitement des boues residuaires: Generalites et applications a l'industrie du papier),
W75-03898 5D

Characterization and Dewaterability of Water Treatment Plant Residues,
W75-04039 5D

SMALL WATERSHEDS
Protecting Creeksheds: Development and Evaluation of a Method to Manage Small, Urbanizing Watersheds Through Local Government Actions,
W75-03947 4D

Protecting Creeksheds, Analysis and Action,
W75-03948 4D

Crest-Stage Gaging Stations in Oregon--A Compilation of Peak Data Collected from October 1952 to September 1974,
W75-03969 7C

Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W75-04254 5B

The Measurement of Impacts in Small Watersheds for Flood Control,
W75-04341 4A

SNAKE RIVER (IDA)
Evaluation of Irrigation Systems in the Snake River Fan, Jefferson County, Idaho,
W75-04032 3F

SNOW
Determination of Radioisotope Fallout From Its Content in Chronological Layers of High-Altitude Glaciers,
W75-04057 5A

Horizontal Water Migration of Strontium-90,
W75-04066 5B

Natural Snowflake Radioactivity Due to Short-Lived Radon Decay Products,
W75-04107 5A

SNOW COVER
Deep Snow Measurements Suggested Using Cosmic Radiation,
W75-04331 2C

SNOW MANAGEMENT
General Disposition and Aquatic Environmental Effects of Silver Iodide in Precipitation Management,
W75-04255 3B

SNOWFLAKES
Natural Snowflake Radioactivity Due to Short-Lived Radon Decay Products,
W75-04107 5A

SOCIAL CHANGE
Some Socio-Agricultural Changes as a Result of Introduction of Irrigation in a Desert Region,
W75-03951 3F

SOCIAL IMPACT
Irrigation's Impact on Society.
W75-04138 3F

SOCIAL PARTICIPATION
Protecting Creeksheds, Analysis and Action,
W75-03948 4D

SOCIOECONOMIC MODELS
Water Resources Evaluation of the Southern High Plains of New Mexico,
W75-04042 4B

SODIUM
Cosmogonic Sodium-22 and Beryllium-7 Isotopes in Investigations of Atmospheric Dynamics,
W75-04081 5B

Concentration of Sodium Radioisotopes in the Ground Layer of the Atmosphere and in Precipitation,
W75-04085 5A

Distribution of Boron in Salt Affected and Contiguous Normal Soils,
W75-04141 2G

SOIL ADSORPTION BEDS
Soil Adsorption of Humic Color,
W75-04043 5D

SOIL AGGREGATES
Effect of Sulfuric Acid and Sulfur Dioxide on the Aggregate Stability of Calcareous Soils,
W75-03952 2G

SOIL CHEMICAL PROPERTIES
Influence of Irrigation Water Quality on Exchangeable Sodium Percentage in a Sodic Soil,
W75-04136 2G

SOIL CLASSIFICATION
Temperature Regimes and Classification of Some Well-Drained Alpine Soils in Alaska,
W75-04314 2G

SOIL COLUMNS
Isolated Soil Columns for Plant Research: Procedure and Uniformity Trial,
W75-04321 3F

SOIL CONSERVATION
Effect of Nitrate and Sediment Constraints on Economically Optimal Clay Production,
W75-04349 4D

SOIL CONTAMINATION
Accumulation of Strontium-90 in Soils,
W75-04062 5B

Cesium-137, Strontium-90, and Lead-210 in Soil of the Far North Regions,
W75-04063 5B

Separate Determination of Rn, RaA, RaB, and RaC Concentrations in Air from the Alpha-Activity Decay Curve of a Filter,
W75-04095 5A

Graphoanalytical Method for Determining Cesium-137 Concentration in Soil Samples from the Gamma Spectrum,
W75-04101 5A

SOIL DENSITY
A Flotation Method for the Rapid Measurement of the Wet Bulk Density of Soil Clods,
W75-04135 2G

SOIL EROSION
Effect of Sulfuric Acid and Sulfur Dioxide on the Aggregate Stability of Calcareous Soils,
W75-03952 2G

Characteristics and Prediction of Soil Erosion on a Watershed in the Palouse,
W75-04033 2J

SOIL MOISTURE
The Three Stages of Drying A Field Soil,
W75-03965 2D

Relation of Soybean Leaf Water Potential to Soil Water Potential,
W75-03989 3F

Effect of Soil Moisture Regimes, Phosphorus and Nitrogen on N and P Uptake by Barley (Hordeum Vulgare L.),
W75-03991 3F

The Effect of Gypsum Treatment on the Swelling of Natural Clods of a Clay Soil,
W75-04132 2G

The Effect of Various Rates of Semicontinuous Drip Irrigation on Lettuce, (Lactuca Sativa L.) Grown in Greenhouse,
W75-04146 2I

Use of a Microwave Remote Sensor for Determination of Water in Subsoils,
W75-04149 2G

Evaluation of Criteria for Separating Soils with Xeric and Udic Moisture Regimes,
W75-04312 2G

Effect of Level Terraces on Soil Moisture Content and Utilization by Corn,
W75-04315 3F

Effect of Stored Soil Moisture Reserve Through Conservation Practices and Supplemental Irrigation on Wheat Yield Under Dryland Farming Condition,
W75-04346 3F

SOIL MOISTURE METERS
Application of Surface Moderators to Measurement of Water Content in Field Topsoils with a Neutron Moisture Depth Gauge,
W75-03940 2G

A Gamma Transmission Method for the Determination of Moisture Content in Soils,
W75-04343 2G

SOIL PROFILES
Distribution and Migration of Strontium-90 in Soils,
W75-04065 5B

Lysimetric and Chemical Investigations of Pedological Changes: I. Lysimeters and Their Drainage Waters,
W75-04311 2G

SOIL PROPERTIES
Effect of Tractor Traffic, Surface Mulch and Seedbed Configuration on Soil Properties,
W75-04316 3F

SOIL STABILITY
Effect of Sulfuric Acid and Sulfur Dioxide on the Aggregate Stability of Calcareous Soils,
W75-03952 2G

SOIL SURFACE.S
Dune Sand Stabilization with Synthetic Soil Conditioners: A Laboratory Experiment,
W75-03953 2G

SOIL TEMPERATURE
Effect of Soil Temperature on Direction of Corn Root Growth,
W75-03954 3F

Corn Root-Configuration Response to Soil Temperature and Matric Suction,
W75-04288 3F

SOIL TERPERATURE
Temperature Regimes and Classification of Some Well-Drained Alpine Soils in Alaska,
W75-04314 2G

SOIL TESTS
Distribution of Humus and Avalable Nutrients in Soil Under Sown Pastures in an Arid Environment,
W75-03958 3F

SOIL TEXTURE
Comparison of Some Methods for Determining Organic Phosphorus in Some Nigerian Soils,
W75-04139 2G

SOIL TREATMENT
The Effect of Gypsum Treatment on the Swelling of Natural Clods of a Clay Soil,
W75-04132 2G

Effects of Natural Microbial Preparations on the Electrokinetic Potential of Bacterial Cells and Clay Minerals,
W75-04317 5B

SOIL TYPES
Comparative Distribution of Strontium-90 and Cesium-137 in Different Types of Soils,
W75-04064 5B

Comparison of Some Methods for Determining Organic Phosphorus in Some Nigerian Soils,
W75-04139 2G

Loess Distribution on a Wisconsin-Age Till Plain in Southwestern Ohio,

STATE LEGISLATION
Regional Management of Waste Systems,
W75-04000 5D

STATE POLICY
Opinion of the Justices to the House of Representatives (Relating to the Constitutionality of a Bill Creating a Public 'On-Foot Free Right-of-Passage' Along Shore of Coastline)
W75-04294 6E

Courts Back State's Power to Halt Acid Mine Drainage,
W75-04301 5G

STATISTICAL ANALYSIS
A Method for Maintaining Cross and Serial Correlations and the Coefficient of Skewness Under Generation in a Linear Bivariate Regression Model,
W75-04309 2E

CRE: A Method for Solving Probability Problems Related to Hydrologic Time Series,
W75-04310 2E

STATISTICAL MODELS
Stochastic Models for the Interaction of Rainfall and Groundwater Levels,
W75-03949 2A

Application of the Stochastic Approach to the Problem of the Radioactivity of Raindrops and Cloud-Borne Drops,
W75-04074 5B

STATISTICS
The Approximate Probability Density Function of Range and Adjusted Range,
W75-04246 6A

STEADY FLOW
The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

STEREO ORIFICES
The Use of Stereo, Horizontal, and Ground Level Orifice Gages to Determine a Rainfall-Elevation Relationship,
W75-04330 2B

STOCHASTIC MODELS
Stochastic Models for the Interaction of Rainfall and Groundwater Levels,
W75-03949 2A

STOCHASTIC PROCESSES
Chance-Constrained Dynamic Programing and the Optimization of Water Resource Systems,
W75-03934 4A

Stochastic Simulation of Daily Rainfall,
W75-04036 2B

Application of the Stochastic Approach to the Problem of the Radioactivity of Raindrops and Cloud-Borne Drops,
W75-04074 5B

STOPPING MANEUVER
Stopping Distances of V.L.C.C. in IJmuiden,
W75-03925 8B

STORAGE
Integrated System Identification and Optimization for Conjunctive Use of Ground and Surface Water, Phase II,
W75-03853 4B

STORM RUNOFF
The Unit Hydrograph: A Satisfactory Model of Watershed Response,
W75-04344 2A

STORMS
Project Skywater.
W75-04265 3B

STRATIFICATION
The Shape of the Interface in Steady Flow in a Stratified Aquifer,
W75-04329 2F

STRATOSPHERE
Vertical Distribution of Radioactive Aerosols in the Troposphere Over the European USSR in 1964-1967,
W75-04055 5B

Utilization of Natural Radioactive Substances in the Study of Turbulent Exchange and Atmospheric Scavenging by Means of Ground Measurement,
W75-04077 5B

Seasonal Beryllium-7 Variations in Ground Level Air,
W75-04084 5A

STREAMFLOW
Model-Prototype Comparisons for Transverse Mixing in Rivers,
W75-03918 8B

The Hydraulic Geometry of a Discontinuous Ephemeral Stream in a Bajada Near Tucson, Arizona,
W75-04125 2E

A Set of Regime Equations For Indirectly Estimating Stream Flow Characteristics,
W75-04245 2E

More Streamflow After a Bark Beetle Epidemic,
W75-04342 4C

STREAMS
Laboratory Studies on Transverse Mixing in Rivers,
W75-03928 8B

The Dilution Capacity of Small Streams in South Carolina,
W75-04050 5B

STRIP MINES
Shallow Ground Water in Selected Areas in the Fort Union Coal Region.
W75-03974 5B

STRONTIUM
Rate of Atmospheric Fallout of Cesium-137 and Strontium-90 Aerosols,
W75-04061 5A

Accumulation of Strontium-90 in Soils,
W75-04062 5B

Cesium-137, Strontium-90, and Lead-210 in Soil of the Far North Regions,
W75-04063 5B

Comparative Distribution of Strontium-90 and Cesium-137 in Different Types of Soils,
W75-04064 5B

Distribution and Migration of Strontium-90 in Soils,
W75-04065 5B

Horizontal Water Migration of Strontium-90,
W75-04066 5B

State of Strontium-90, Cesium-137, and Cerium-144 in Radioactive Fallout,
W75-04071 5B

Radiochemical Method of Determining Low Strontium-90 Concentration Levels in Environmental Samples,
W75-04102 5A

SUBSOIL
Use of a Microwave Remote Sensor for Determination of Water in Subsoils,
W75-04149 2G

SUBSURFACE WATERS
Identification of a Distributed Parameter System in Hydrology,
W75-04280 2F

SULFATE REDUCTION
Sulfate Reduction and Sulfide Oxidation in Flooded Soil as Affected by Chemical Oxidants,
W75-04347 5B

SULFIDE OXIDATION
Sulfate Reduction and Sulfide Oxidation in Flooded Soil as Affected by Chemical Oxidants,
W75-04347 5B

SULFIDE-SELECTIVE ELECTRODE
Determination of Parts Per Billion Sulfide in Water with the Sulfide-Selective Electrode,
W75-04021 5

SULFIDES
Determination of Parts Per Billion Sulfide in Water with the Sulfide-Selective Electrode,
W75-04021 5

SULFITE LIQUORS
Control of Reverse Osmosis Membrane Hydrolysis with Dynamically Formed Woven Chemical Membranes,
W75-03890

SULFUR
Use of Sulfur for Combatting Oil Spills,
W75-03869 5G

SULFUR COMPOUNDS
Effect of Sulfuric Acid and Sulfur Dioxide on the Aggregate Stability of Calcareous Soils,
W75-03952 2G

SUNFISHES
Comparative Biochemistry, Biodegradability, and Toxicity of DDT and Carbofuran Analogues,
W75-04034 5C

SUPPLEMENTAL IRRIGATION
The Development of Supplemental Water: Resource Flexibility and Farm Management Options,
W75-04031 3F

SURFACE DRAINAGE
Surface Water Data of the Upper Michigan Region Project Sanguine, Site Study.
W75-04277 2E

SURFACE-GROUNDWATER RELATIONSHIPS
Groundwater Storage-Riverflow Relations in a Chalk Catchment,
W75-04339 2A

SURFACE RUNOFF
Evaluation of Irrigation Systems in the Snake River Fan, Jefferson County, Idaho,
W75-04032 3F

Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W75-04254 5B

Surface Water Data of the Upper Michigan Region Project Sanguine, Site Study.
W75-04277 2E

Ford Motor Co. V. Dallas Power and Light Co. (Action for Property Damage Resulting from Release of Waters from Dam During Time of Flooding).
W75-04297 6E

SURFACE WATER AVAILABILITY
Surface Water Data of the Upper Michigan Region Project Sanguine, Site Study.
W75-04277 2E

SURFACE WATERS
Hydrologic Data for 1973, Broward County, Florida,
W75-03976 3B

Water-Resources Investigations of the U.S. Geological Survey in the Northern Great Plains Coal Region of Eastern Montana, 1974-75.
W75-03977 7C

Quality and Availability of Water in Westernmost Texas,
W75-03979 2K

Some Results from Experimental Data on Surface Jet Discharge of Heated Water,
W75-04220 5B

URVEILLANCE PROGRAM
Entrainment of Stratospheric Tritium: Another Radiological Anomaly of the Rocky Mountain West,
W75-04162 5A

SURVEYS
Assessment of Public Radiation Exposure in the Vicinity of U.S. Aec Sites,
W75-04194 5A

Relationship Between Limnological Conditions of Reservoirs and Watershed Features - A Survey,
W75-04244 2H

SUSPENDED SOLIDS
On the Application of Polyelectrolytes to White Water Treating by Dissolved-Air Flotation (In Japanese),
W75-03884 5D

SWITZERLAND (BAYE DE MONTREUX)
The Use of Stereo, Horizontal, and Ground Level Orifice Gages to Determine a Rainfall-Elevation Relationship,
W75-04330 2B

SYNTHETIC HYDROLOGY
A Method for Maintaining Cross and Serial Correlations and the Coefficient of Skewness Under Generation in a Linear Bivariate Regression Model,
W75-04309 2E

SYSTEMS ANALYSIS
Water for the Human Environment, Volume IV, Special Sessions.

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 8, NUMBER 9
MAY 1, 1975

THE LIBRARY OF THE
MAY 22 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W75-04351 -- W75-04850

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 8, NUMBER 9
MAY 1, 1975

W75-04351 -- W75-04850

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

THE COALESCENCE OF WATER DROPS,
Tel Aviv Univ. (Israel). Dept. of Environmental Sciences.
Z. Levin.
Available from the National Technicalp 41, Information Service, Springfield, Va. 22161, as AD-784 198, $3.75 in paper copy, $2.25 in microfiche. Report No E1607, p 41, August 1974. 10 fig, 3 tab, 16 ref. DAJA37-73-C-1580.

Descriptors: *Drops(Fluids), *Coalescence, Viscosity, Viscous flow, Theoretical analysis, *Model studies, Electricity, Equations, Physical properties.
Identifiers: *Collision-coalescence process, *Water drops, Equations of motion, Oscillations, Drop deformation.

The first year results of a theoretical study to explain the phenomena of coalescence of drops were presented. Even though the model represents a gross simplification of the real situation, it shows remarkable agreement with some recent experimental results. At this stage the model investigates the effects of the viscous force between the interacting drops, but future work will include both the effects of the electrical double layer and the oscillation of the surfaces of the drops. (Jones-ISWS)

2. WATER CYCLE

RELATION OF OROGRAPHIC WINTER PRECIPITATION PATTERNS TO METEOROLOGICAL PARAMETERS,
National Weather Service, Silver Spring, Md. Office of Hydrology.
E. L. Peck.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 234-242, 1973. 1 fig, 3 tab, 5 ref.

Descriptors: *Precipitation(Atmospheric), *Mountains, Winter, *Orography, Statistical methods, Correlation analysis, Regression analysis, Variability, Radiosondes, *Utah, Temperature, Dew point, Condensation, Advection.
Identifiers: *Wasatch Front range(Utah), Vorticity, Vertical velocity, Wet bulb potential temperature.

Patterns of orographic precipitation in the western United States are subject to considerable variation. Knowledge and predictability of these variations would provide a basis for improved short- and long-term streamflow forecasts and precipitation analyses. Previous studies have demonstrated that observed variations in precipitation distribution are related to types of synoptic situations. Multivariate (canonical) correlation analyses were used to determine whether meteorological parameters may be used to predict the distribution patterns of winter precipitation without the need for storm typing. Twelve-hour precipitation values for stations in the Wasatch Front range of northern Utah having a large range of elevation were correlated with meteorological parameters derived from concurrent radiosonde observations. The meteorological parameters were sufficient to define general precipitation patterns for winter orographic precipitation. (See also W75-01961) (Jones-ISWS)

2B. Precipitation

TORNADO OR DUST DEVEL: THE ENIGMA OF DESERT WHIRLWINDS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
S. B. Idso.
American Scientist, Vol 62, No 5, p 530-541, September-October, 1974. 11 fig, 42 ref.

Descriptors: *Tornadoes, *Dust storms, *Fronts(Atmospheric), *Wind velocity, *Turbulence, Thunderstorms, Cyclones, Meteorology, Mountains, Weather patterns, Model studies, Arizona, Air circulation, Vortices, Air-earth interfaces.

Large dust devils can be more destructive than weak tornadoes, and both have similar morphology and life cycles. Tornadoes usually occur with parent clouds, and dust devils form in clear air, but gradations between them exist. Descriptions and photographs from southern Arizona show the similarity. Worldwide observations and theories are reviewed. Both types are compared to vortices associated with several kinds of density currents, including snow avalanches, volcanic ash flows, cold fronts, and haboobs (arid land dust storms generated by cold air outflow from thunderstorms). New models proposed explain how a haboob-formed vortex can become a tornado, and how a small mountain can induce twin vortex formation. More organized observations are needed. (Duffield-Arizona)
W75-04372

SOME CHARACTERISTICS OF HAWAIIAN HIGH-INTENSITY RAINFALL,
Hawaii Univ., Honolulu. Water Resources Research Center.
C. M. Fullerton, and S. K. Wilson.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 398, $4.25 paper copy, $2.25 microfiche. Technical Report No 78, UHMET 74-01, August 1974. 47 p, 29 fig, 4 tab, 33 ref. OWRT B-026-HI (1), 14-31-0001-3872.

Descriptors: *Rainfall intensity, *Rain gages, *Networks, Atmospheric pressure, Wind velocity, Winds, Computer models, Air temperature, *Hawaii, Instrumentation, Clouds.
Identifiers: *Raindrop size, Potential gradient, Microbarograph, *Showers.

A computer monitored network of rapid response Raymond-Wilson rainfall intensity gauges has been established at the Cloud Physics Observatory (CPO), on the windward coast of the island of Hawaii, to record the passage of both warm and cold showers. These showers are characterized by high intensity rainfall (50 to 300 mm/hr) and an associated increase in atmospheric pressure, a change in wind velocity, and a reversal of the electric potential gradient. The showers often occur at night, during the maximum of the diurnal pressure oscillation, and frequently in groups of two to four with an interval of 103 to 104 seconds between separate showers. A relationship between the height of the base of the trade wind inversion and the total amount of rainfall was observed, indicating that almost no rainfall occurs if the inversion base is less than 2 km. A drop-size instrument (DSI) was developed and used to measure the raindrop-size spectrum. From this measurement and the rainfall intensity, an estimation of the liquid water content (LWC) of precipitating clouds was derived. The LWC (2.0 to 8.0 g/m3) was larger than that generally assumed for trade wind showers.
W75-04442

RAINFALL PATTERNS AND GENERAL ATMOSPHERIC CIRCULATION,
D. Winstanley.
Nature, Vol 245, September 28, 1973. p 190-194, 1 tab, 7 fig, 18 ref.

Descriptors: *Rainfall, *Climatic data, *Circulation, Long-term planning, Arid climates, Climatology, Climatic zones, Isohyets, Atmosphere, Drought.
Identifiers: *Sahel zone, Mediterranean, Middle east, India, Sahara Desert.

Rainfall records of the Mediterranean, the Middle East, the Sahel Zone, and north-west India from the beginning of this century were analyzed. Rainfall fluctuations are related to changes in the general circulation of the atmosphere. From the analysis, an idea of long term rainfall prospects and future climatic patterns can be obtained. In these marginal arid areas like the Sahara, human response to low and variable rainfall is nomadism. Climatology will play an important role in long term planning in economic and political problems of the affected countries. (Mastic-Arizona)

A POSSIBILITY OF AIRFLOW - PRECIPITATION REGIME INVESTIGATIONS,
Hydrometeorological Inst. of Croatia, Zagreb (Yugoslavia).
N. Sinik.
In: Distribution of Precipitation In Mountainous Areas, Vol. II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 128-139, 1973. 6 fig, 2 tab, 6 ref.

Descriptors: *Precipitation(Atmospheric), *Forecasting, *Statistical methods, *Mountains, Isohyets, Hydrology, Correlation analysis, Probability, Orography, Forecasting, Distribution patterns.
Identifiers: *Gradient flow, Rain days, Airflow, *Yugoslavia(Lika-Gorski Kotar).

Daily precipitation patterns for Gorski Kotar and Lika (Yugoslavia) were correlated with the prevailing gradient windflow as determined from the corresponding 1000 and 850 mb pressure patterns. The cases where the wind directions were nearly the same at both pressure levels were determined and the isohyetal pattern for those unique cases drawn. It was found that only rainy days with stationary gradient flows at the 1000 mb surface could be added to the cases with parallel flows at both pressure surfaces. The project was confined to the year 1962 and additional study was recommended to insure that the results are applicable as a forecast device for precipitation expectation with wind direction. (See also W75-01961) (Jones-ISWS)
W75-04660

CHARACTERISTICS OF PRECIPITATION IN THE SCOTTISH HIGHLANDS,
Oxford Univ. (England). Dept. of Agricultural Science.
F. H. W. Green.
In: Distribution of Precipitation In Mountainous Areas, Vol. II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 140-146, 1973. 2 fig, 4 ref.

Descriptors: *Precipitation(Atmospheric), *Topography, Rainfall, Snowfall, Mountains, Rainfall disposition, Distribution patterns, Measurement.
Identifiers: *Scotland(Highlands), Rain days, Hoar frost, Potential evaporation, Potential water deficit.

Precipitation in the Scottish Highlands has highly individual characteristics resulting from the location of Scotland and from its topography. For the same reasons, difficulties in accurate measurement are increased. It was found that the largest annual totals were found on the west coast and this was attributed to the movement of precipitation systems from west to east and most of the precipitation falling on the higher mountains of the west coast. It was also found that precipitation intensity was greater in the highlands than in the lowlands. The potential water deficit was found to be lowest in the highlands of western Scotland, indicating that this area is wetter than any other part of Europe. The occurrence of hoar frost is frequent, but no means have been found to measure its contribution to the total precipitation. Measurements and computation of potential evaporation indicates that precipitation measurements are 5% too low because of the windiness of the highlands. (See also W75-01961) (Jones-ISWS)
W75-04661

RAINFALL AT THE HOHENPEISSENBERG AND THE WEATHER SITUATION,
R. Aniol.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 147-155, 1973. 5 tab, 9 ref.

Descriptors: *Precipitation(Atmospheric), *Mountains, Chinook, Weather patterns, Rain, Advection, Pressure, Distribution, On-site data collections.
Identifiers: *Germany(Hohenpeissenberg Mt), Cold fronts, Warm fronts.

For the summer months during the period 1965-1970, 648 single precipitations at the Hohenpeissenberg were checked for the weather situation. Three main types could be selected. These main weather types show different aerological vertical profiles in the lower part of the troposphere. The total amount, the duration, and the intensity of rain showed significant differences for the main weather types. The main weather types were: advection of cold air, advection of warm air, and weak pressure gradients. It was shown that the presence of the mountain, Hoher Peissenberg, and warm or cold air advection determines the duration and intensity of the precipitation. (See also W75-01961) (Jones-ISWS)
W75-04662

COMPUTATION OF AIR FLOW OVER MOUNTAINS IN STATICALLY STABLE SITUATIONS,
Oslo Univ. (Norway). Inst. of Geophysics.
A. Eliassen.
In: Distribution of Precipitation in Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326, Geneva, Switzerland, 1972. p 156-160, 1 ref.

Descriptors: *Winds, *Mountains, *Mathematical models, *Computer models, Meteorology, Precipitation(Atmospheric), Orography.

Mesoscale features of flow patterns over mountains were determined by numerical integrations, with special emphasis on the distribution of the ascending motions causing orographic clouds and precipitation. (See also W75-01961) (Sims-ISWS)
W75-04663

OROGRAPHIC INFLUENCES ON DISTRIBUTION OF PRECIPITATION,
Oslo Univ. (Norway). Inst. of Geophysics.
K. Pedersen.
In: Distribution of Precipitation In Mountainous Areas, Vol. II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 161-170, 1973. 5 fig, 1 ref.

Descriptors: *Orography, *Precipitation(Atmospheric), *Computer models, Terrain analysis, Winds, Pressure, Radiosondes.
Identifiers: *Geostrophic equations, *Norway, Grid mesh, Smoothing operator, Vertical velocity.

A terrain profile of Norway representative for a grid having a mesh-size of 50 km was estimated as proper for studying the terrain-induced vertical displacements of the air. Using a quasi-geostrophic set of equations, the vertical displacements and the resulting condensation were computed for a given situation, September 4-5, 1968. (See also W75-01961) (Jones-ISWS)
W75-04664

DISTRIBUTION OF PRECIPITATION IN THE SOGNEFJORD REGION,
Bergen Univ. (Norway). Geofisisk Institutt.
E. Skaar.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 171-185, 1973. 6 fig, 4 ref.

Descriptors: *Precipitation(Atmospheric), *Mountains, Wind, Fjords, Valleys, Coasts, *Distribution patterns, Agroclimatology, Weather data, On-site data collections.
Identifiers: *Norway(Sognefjord Region).

During the years 1963-1966 an agroclimatic investigation was carried out in the Sognefjord region, a mountainous area of approximately 11,000 sq km. Daily precipitation amount was measured at 145 stations in the period April to October and at 50 stations in winter. The coast districts are among the most precipitous in Norway. Thus, the average annual precipitation at Brekke is 3354 mm. The valleys at the head of the easternmost parts of the fjord (Laerdal) get only about one-ninth of this amount. The three years concerned, 1964-1966, include one 'wet' year, one 'dry' year, and one year with a near average precipitation amount. The mapping of the distribution of precipitation in this area must to some extent be based on theoretic considerations because most of the stations were sited near the fjord. The distribution pattern is dependent on the general weather type, mainly the wind conditions. This was illustrated by selected short-periods in situations of different weather types. (See also W75-01961) (Jones-ISWS)
W75-04665

MAXIMUM DAILY PRECIPITATION IN GORSKI KOTAR AND LIKA (YUGOSLAVIA) IN RELATION TO THE OVERFLYING AIRSTREAM,
Hydrometeorological Inst. of Croatia, Zagreb (Yugoslavia).
N. Plesko.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972 World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 186-197, 1973. 6 fig, 1 tab, 5 ref.

Descriptors: *Precipitation(Atmospheric), *Air circulation, *Excessive precipitation, *Local precipitation, *Probable maximum precipitation, Precipitation intensity, Climatology, Storms, Weather patterns, Winds, Isohyets, Mountains,

Distribution patterns, Climates, Geographical regions, Synoptic analysis.
Identifiers: *Yugoslavia(Gorski Kotar and Lika).

The areal distribution of precipitation daily maximums in Gorski Kotar and Lika (Yugoslavia) was studied in relation to the prevailing airstreams in the atmospheric layer from the earth surface and up to the height of about 1500 m. The isohyetal charts of daily maximums were elaborated for each of eight main wind directions. Based on the theory of Jenkinson the estimates of daily maximums were found for various return periods and for selected stations as well as their maximum expected values. (See also W75-01961) (Huff-ISWS)
W75-04666

STATISTICAL CONSIDERATIONS ABOUT SNOW CONDITIONS IN THE AUSTRIAN ALPS,
Zentralanstalt fuer Meteorologie und Geodynamik, Vienna (Austria).
For primary bibliographic entry see Field 2C.
W75-04667

ABOUT VERTICAL GRADIENTS OF LIQUID PRECIPITATION IN MOUNTAINS,
Hydrometeorological Service of the USSR, Moscow.
A. P. Zhidikov, and A. G. Levin.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 204-211, 1973. 5 fig, 1 ref.

Descriptors: *Precipitation(Atmospheric), *Mountains, *Winds, Rain gages, Isohyets, *Distribution patterns, Wind velocity, Meteorology.
Identifiers: *Liquid precipitation, USSR.

In order to get true vertical representation of precipitation in mountains, vertical profiles of measured precipitation and wind in specified mountainous areas should be taken in combination. Comparisons were made of actual vertical gradients of precipitation with gradients of measured precipitation affected by wind. Suggestions were made for the observational procedures to investigate vertical distribution of liquid precipitation as well as for the procedures to map isohyets of liquid precipitation in mountainous areas. (See also W75-01961) (Jones-ISWS)
W75-04668

METHODS FOR THE STUDY OF LAWS FOR THE DISTRIBUTION OF PRECIPITATION IN MEDIUM-HIGH MOUNTAINS (ILLUSTRATED BY THE VITIM RIVER BASIN),
Gidrometeorologicheskii Institut, Leningrad (USSR).
V. S. Vuglinski.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 212-221, 1973. 6 fig, 3 tab, 5 ref.

Descriptors: *Precipitation(Atmospheric), *Moountains, *Distribution patterns, Water balance, Evaporation, Runoff, Seasonal, Radiation, Orography, Equations.
Identifiers: Radiation balance, Turbulent heat exchange, *USSR(Vitim River Basin).

Methods for the computation of mean annual and monthly precipitation for mountain basins were illustrated by the Vitim River basin in the Trans-Baikal area. On the basis of data from the standard meteorological network with relations between precipitation and the altitude of the region, long-term mean annual and monthly precipitation patterns for individual basins were computed. The areal distribution of precipitation was accounted for by the local orography. Diagrams of the transformation of moisture fluxes over mountainous terrain were presented. A possibility for the determination of mean long-term annual precipitation for mountain basins in the absence of observational data on runoff and radiation balance was considered with the use of the equations of Schreiber, Oldekopp, and Budyko. (See also W75-01961) (Jones-ISWS)
W75-04669

THE DISTRIBUTION OF PRECIPITATION IN SOME MOUNTAINOUS CANADIAN WATERSHEDS,
Atmospheric Environment Service, Calgary (Alberta).
D. Storr, and H. L. Ferguson.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 243-263, 1973. 16 fig, 3 tab, 18 ref.

Descriptors: *Demonstration watersheds, *Watersheds(Basins), *Precipitation(Atmospheric), Rainfall, Rainfall-runoff relationships, *Distribution patterns, *Canada, Slopes, Snowmelt, Snowpacks, Water loss, Water balance, Rain gages, Evapotranspiration, Mountains, Rocky Mountain region, Data collections.
Identifiers: Alberta, British Columbia.

Several research investigations in western Canada include studies of the distribution of precipitation in mountainous regions. Five such projects were described. Three of these are International Hydrologic Decade experimental basin projects located on the eastern slopes of the Rocky Mountains in Alberta. Five to ten years of record were available for these basins and problems of gage exposure, network design, and data collection and analysis were discussed in detail. Two projects in British Columbia, one on Vancouver Island, and another in the Okanagan Basin in the interior, were established more recently and only preliminary results could be provided at this time. PHYSIOGRAPHICALLY ADJUSTED PRECIPITATION-FREQUENCY MAPS,
National Weather Service, Silver Spring, Md. Office of Hydrology.
J. F. Miller.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 264-277, 1973. 4 fig, 2 tab, 13 ref.

Descriptors: *Frequency analysis, *Distribution patterns, *Flood recurrence interval, *Orography, *Precipitation(Atmospheric), Rainfall disposition, Precipitation excess, Precipitation intensity, Storms, Snowfall, Weather patterns, Depth-area-duration analysis, Topography, Climatic data, Climatic zones, Moisture, *Maps, Mapping.
Identifiers: Partial duration series, *Index relations.

Recent investigations of the precipitation-frequency regime in the United States have focused on the mountainous western portion of the country. These investigations have attempted to depict the variations of the precipitation-frequency regime with the variations in physiographic factors for return periods between 2 and 100 years and durations of 6 and 24 hours. Relationships between precipitation-frequency data at stations and topographic and climatic parameters, such as elevation, exposure, and normal annual precipitation, were developed to aid in understanding these variations. These relationships were used in the preparation of generalized isopluvial charts. In some portions of the mountainous western United States, snow contributes significantly to the series of extreme precipitation amounts. In these regions, an additional set of maps were prepared to depict the precipitation-frequency regime for the May to October season, when practically all heavy precipitation is in the form of rain. W75-04672

THE CHARACTERISTIC CHANGES OF THE AMOUNT OF PRECIPITATION IN CONNECTION WITH ALTITUDE IN THE MOUNTAINOUS AREAS OF YUGOSLAVIA,
Federal Inst. of Hydrometeorology, Belgrade (Yugoslavia).
I. Delijanic.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 278-289, 1973. 5 fig, 1 tab.

Descriptors: *Precipitation(Atmospheric), *Mountains, *Orography, Valleys, Gages, Statistical methods, Regression analysis, Climates, Distribution patterns.
Identifiers: *Yugoslavia, Vertical gradients, Precipitation regions. Atmospheric circulations.

During the preparation of a climatic atlas of Yugoslavia, a series of charts of mean precipitation were prepared. The scarcity of gages in certain districts, particularly in the mountains, required that a means of estimating the precipitation be found. The estimation is complicated in that the records were not homogeneous for the entire period from 1931 through 1960 and the different source regions of moisture and wind regimes cause the different mountainous regions to respond differently to the precipitation-bearing air masses. The inhomogeneous records were resolved through the use of very detailed statistical analysis. The altitude-precipitation relationships were solved by partitioning the country into regions, generally along ridge and valley lines, with similar response characteristics and applying correlation techniques. W75-04673

DISTRIBUTION OF PRECIPITATION IN MOUNTAINOUS AREAS OF WEST PAKISTAN,
Pakistan Meteorological Dept., Karachi.
F. C. K. Alam.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switerland, p 290-306, 1973. 6 fig, 2 tab, 10 ref.

Descriptors: *Mountains, *Precipitation(Atmospheric), Isohyets, Rain gages, Topography, Snow, Probable maximum precipitation, Mass curves, Basic data collections, *Distribution patterns.
Identifiers: *Pakistan, Double mass curve technique.

With the inception of the Indian Meteorological Department in 1875, systematic recording of daily rainfall was initiated in the Indo-Pak sub-continent. Prior to 1961, the normal and other isohyetal maps drawn on the basis of available data were found unsatisfactory for the hilly areas. Following the signing of the Indus Basin Treaty 1960, special hydrometeorological studies were taken up in the Pakistan Meteorological Department for the implementation of the Water Resources Projects connected with the Indus Basin Development Plan. By 1961, though the network of raingages had fairly improved, the undeveloped and inaccessible areas, particularly the

mountainous areas of the Northern region were still inadequately or completely ungaged. Consequently, in the studies conducted since 1961, the technique of analysis ensuring homogeneity and accuracy of data were employed. However, the primary draw-back of lack of basic data was considerably eliminated by developing the elevation-barrier-precipitation relationship, depicting the effect of topography of the area on the resultant precipitation. These relationships varied with the season as well as with different project areas. The topographically adjusted normal isohyetal maps thus developed were found to provide reliable results in the computation of the probable maximum precipitation studies. These studies also provided an objective basis for improving the precipitation network in the mountainous areas. (See also W75-01961) (Jones-ISWS)

PRECIPITATION IN TAIWAN MOUNTAINOUS AREAS,
P. S. Pan.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 307-321, 1973. 14 fig, 2 tab, 10 ref.

Descriptors: *Precipitation(Atmospheric), *Mountains, Monsoons, Raingages, Rainfall, Snow, *Orography, Islands, Air circulation, Winds, Runoff, Infiltration, Convection, Cyclones, Isohyets, Elevation, Networks, Typhoons, *Weather.
Identifiers: *Taiwan.

Located astride the Tropic of Cancer, Taiwan has a subtropical climate. Meteorologically, the island is amidst the East Asian Monsoon system, beside being a favorite target of typhoons. Because of its distance from the southern hemisphere source regions, the summer southwest winds approaching Taiwan are weaker and less regular than their winter northeast counterparts. The island receives very little snowfall, even in mountain peaks, exceeding 3000 meters in height; the annual island precipitation attributable mainly to monsoons and typhoons averaged to 2340 milimeters (92 inches). Due to rugged topography and the Central Mountain Range oriented 25 degrees to the northeast, the orographic effect has a great influence on the distribution of precipitation in mountain areas caused by monsoons, and additional precipitation results on the mountain areas caused by tertiary circulations. Analyses of the weather elements were described, while problems both in measurement and calculation of mountain precipitation in Taiwan by orographic effects were discussed. OROGRAPHIC INFLUENCES ON THE DISTRIBUTION OF PRECIPITATION,
British Meteorological Office, Bracknell (England).
A. Bleasdale, and Y. K. Chan.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 322-333, 1973. 6 fig, 1 tab, 13 ref.

Descriptors: *Mountains, *Precipitation(Atmospheric), Rainfall, Statistical methods, Computers, Data collections, *Distribution patterns, *Orography.
Identifiers: *United Kingdom, Rainfall-height relationships, Five-km rainfall grid.

The predominant influence of orography on the spatial distribution of average annual rainfall over the United Kingdom has been well known for a long time. Apart from a rather small number of studies for separate districts, knowledge of this influence has been largely based on subjective qualitative appreciation. By using a computer and data for several thousand stations, an attempt was made to investigate the influence in a more precise quantitative sense for the whole country and thereby obtain guidance on the nature of the secondary influences. W75-04676

EXTREME THUNDERSTORM RAINFALL IN THE INTERMOUNTAIN WESTERN UNITED STATES,
National Weather Service, Silver Spring, Md. Office of Hydrology.
J. T. Riedel, and E. M. Hansen.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 334-345, 1973. 8 fig, 1 tab, 6 ref.

Descriptors: *Probable maximum precipitation, *Rainfall, *Thunderstorms, *Precipitation(Atmospheric), Mountains, Excessive precipitation, Pacific Northwest U.S., Southwest U.S., *Rocky Mountain region, Depth-area curves, Climatology, Orography, Elevation.

Studies show the intense local thunderstorm is the most critical rain producer for small drainages in the large intermountain region, bordered by the Continental Divide on the east and the Sierra Nevada with their extension, the Cascades, into Canada on the west. Data from such storms, producing rainfalls of 100 to 290 mm in about one hour, were analyzed. Inspection of weather maps generally does not show well-organized systems that account for these occurrences. The seeming lack of simultaneous rains at the nearest surrounding stations, or on adjoining days, points to the local nature of the storms. The development of a generalized chart of probable maximum thunderstorm rainfall was described. Estimates for 1 hour over 2 sq km ranged from 170 to 300 mm within the region. The derived 1-hour rainfall depth-area relation, based on limited data, gave 20% of the 2 sq km value for a 1000 sq km area. Studies to find preferred localities (with respect to terrain features) for most extreme occurrences were described. Some data suggest a decrease in short-duration rains for elevations above 1500 m. Ultimately, for higher elevations, distant from lower valleys, thunderstorm rainfall must begin to decrease. A decrease of 5% per 300 m for elevations above 1500 m was adopted for probable maximum thunderstorm rainfall. (See also W75-01961) (Sims-ISWS)

WATER YIELD AS AN INDEX OF LEE AND WINDWARD TOPOGRAPHIC EFFECTS ON PRECIPITATION,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
H. W. Anderson.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 346-358, 1973. 1 fig, 3 tab, 40 ref.

Descriptors: *Streamflow, *Precipitation(Atmospheric), *Evapotranspiration, *Orography, *Water yield, Watersheds(Basins), Snowmelt, Topography, Elevation, Slopes, Regression analysis, Snow model studies, California.
Identifiers: *Principal component analysis, Barrier height, Sierra Nevada Barrier.

In mountainous areas, the best precipitation maps are derived by distributing streamflow back on the watershed and correcting for evapotranspiration. Special problems arise in the lee of major mountain barriers, such as the Sierra Nevada of California. There, the relation of mean annual streamflow to topography was determined from data for 14 watersheds. Variables indexing effects of rise, air flow separation, spillover, and barrier height explained 99% of the variance; standard error was 11%. Rise and flow separation were important. Streamflow increased for the area 8 km to the lee of the Sierra Nevada ridge, and decreased progressively with elevation above and below about 2700 m. Evapotranspiration estimates were obtained from snow course accumulations during periods with snow only and from the streamflow relations to topography. (See also W75-01961) (Huff-ISWS)
W75-04678

INFLUENCE OF OROGRAPHY ON THE SHARE OF PRECIPITATION IN THE EAST ALPINE HIGH MOUNTAINS,
H. Tollner.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 359-361, 1973.

Descriptors: *Precipitation(Atmospheric), *Mountains, *Orography, Convection, Rainfall disposition, Distribution patterns.
Identifiers: *Eastern Alps, Rain shadows, Totalizers.

During an observational period from 1932 through 1938, it was found by using totalizers that the maximum precipitation occurrence was not realized at higher elevations at the same time that it occurred in the valleys. Similar patterns were revealed in the records from ombroscopes over a longer period of time. The temporal variation of the precipitation maxima were found to be related to: (1) intensification of instability by high-level heat sources with particular solar aspect, (2) rain shadowing of certain areas by mountains upwind during the normal summertime westerly and northwesterly flow, and (3) an unequal increase in springtime of the upslope precipitation. (See also W75-01961) (Jones-ISWS)

ON THE PROBLEM OF VERTICAL DISTRIBUTION OF PRECIPITATION, ESPECIALLY IN AREAS WITH GREAT HEIGHT DIFFERENCES,
Uppsala University, Uppsala (Sweden), Dept. of Physical Geography.
B. E. Ryden.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 362-372, 1973. 3 fig, 2 tab, 9 ref.

Descriptors: *Precipitation(Atmospheric), *Elevation, Mountains, Rainfall, Variability, Regression analysis, Rain gages, Instrumentation, Climates, On-site data collections, Measurement.
Identifiers: *Sweden.

Precipitation was measured by totalizers during the summers of 1967 to 1971 in the high mountains of northern Sweden. The totalizers were of a simple and robust construction, fitting the hard weather conditions at high levels above the tree line. The sites of the instruments covered a vertical distribution of more than 1500 meters in the drainage basin. Results showed a near linear increase of precipitation with altitude. During the season with the higher amount of precipitation, the increase with altitude was greater. (See also W75-01961) (Sims-ISWS)

THE USE OF THE MODIFIED TIME SERIES ANALYSIS TECHNIQUE FOR THE DETERMINATION OF AREAL PRECIPITATION ACCURACIES,
Aston Univ., Birmingham (England).
P. Hutchinson.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 448-465, 1973. 6 fig, 3 tab, 8 ref.

Descriptors: *Network design, *Time series analysis, *Precipitation(Atmospheric), Rainfall, Elevation, Rain gages, Mathematical studies, Areal.
Identifiers: *New Zealand.

Further work on the development and use of a modified time series analysis technique for determining areal precipitation accuracies, with daily rainfall data from an area of accentuated relief was reported. The effect of changes in the lag intervals was in the determination of the 'standard error' of the areal precipitation was studied and simple rules for the selection of the optimum lag interval were presented. For the given areas, the raingage network density was varied, and the effect of this variation on the calculated accuracy of the areal precipitation was shown. Daily precipitations were grouped according to six prevailing synoptic situations, and it was shown that different accuracies of areal precipitation determinations can be expected, depending upon the synoptic situation. The implications of this work for the design of precipitation gage networks were discussed. It was shown that an increase in the number of gages increases the accuracy of the estimate of areal precipitation, but that this increase is much less than may be expected from considerations of random data. It seems likely that the type of synoptic situation has relatively little effect on the standard error. (See also W75-01961) (Sims-ISWS)

P. A. Davis, and S. M. Serebreny.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 474-483, 1973. 3 fig, 2 tab.

Descriptors: *Satellites(Artificial), *Precipitation(Atmospheric), Hydrology, Meteorological data, *Remote sensing, Climatic data, Data collections, Watersheds(Basins), *Mountains, Montana, Clouds.

Existing series of cloud photographs from polar-orbiting satellites were utilized in a technique designed to estimate total precipitation (rain and snow) over a mountainous drainage basin in northwestern Montana. Daily precipitation for the entire basin was defined from analyses of surface observations and climatological data within the basin. Satellite-viewed cloud cover was distinguished in terms of eight exclusive categories representative of differing probable contributions to basin precipitation. After a dominant categorization was assigned to each successive 12-hour period, estimates of the cumulative basin precipitation were obtained by summation of probable amounts assigned to each cloud category. Initial applications of the technique with dependent data indicated that good estimates of the cumulative precipitation could be obtained from satellite data over summation periods of about two weeks during the early winter and about five days during the early summer. Subsequently, the technique was tested with independent data; estimates and observations also were compared with independent estimates of precipitation based on radar data analysis. The feasibility and importance of recognizing visible cloud organization and movements was apparent, but the desirability of including satellite infrared data was suggested. FACTORS AFFECTING THE ESTIMATE OF AREAL AVERAGE SUMMER AND WINTER PRECIPITATION IN A SMALL CATCHMENT OF THE SWISS PREALPS,
Swiss Forest Research Inst., Birmensdorf.
H. M. Keller.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 484-496, 1973. 2 fig, 6 tab, 11 ref.

Descriptors: *Precipitation(Atmospheric), *Watersheds(Basins), Water balance, Rainfall, Snow, Topography, Mountains, Distribution patterns, Alpine, On-site investigations, Winds, Precipitation gages, Areal, *Seasonal.
Identifiers: *Swiss Prealps.

Four years of record from 12 storage and 4 recording precipitation gages as well as from 17 snow courses in a 300 ha catchment ranging from 1120 to 1640 m ASL were analyzed. The local variation in monthly catch of liquid precipitation is best explained by the topographic position of the gages considering prevailing wind conditions in the catchment. In winter storage gages are of restricted use to estimate the distribution of winter precipitation. Snow course data indicate that snow distribution in winter may be estimated using wind speed and potential radiation as topographic parameters. For the estimate of winter precipitation, however, only data from selected gages can be used. Procedures for data adjustment were given to estimate areal average summer and winter precipitation in the catchment. Annual precipitation becomes about 10% higher when using these procedures. SOME INTRA-STORM CHARACTERISTICS OF HIGH-INTENSITY RAINFALL BURSTS,
Forest Service (USDA), Utah. Forest Sciences Lab.
E. E. Farmer, and J. E. Fletcher.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 525-531, 1973. 2 fig, 3 tab, 2 ref.

Descriptors: *Cloudbursts, *Rainfall intensity, *Design storm, *Duration curves, *Probable maximum precipitation, Thunderstorms, Precipitation(Atmospheric), Orography, Basic data collections, Convection, Storms, Frequency analysis, Data processing, Networks, Hydrology.

Basic data for analyses of high-intensity rainfall bursts were obtained from two rainfall intensity gage networks located in central and north central Utah. Twenty-five intensity gage stations are located at altitudes between 1325 and 3095 meters, of these, eighteen gages are at altitudes greater than 2440 meters. Analyses included: (1) intra-storm timing and number of bursts, (2) distribution of storm rainfall by 10% of storm duration, and (3) relationship between depth of total storm rainfall and depth of burst rainfall. More than 50% of the total storm rainfall depth occurs in 25% of the storm period; usually more than half of the total depth of rain is delivered as burst rainfall. Rainfall bursts occur most frequently in the first quarter of the storm period. Design data were presented for storms which contain a burst of 10 minutes or longer with return periods of 2 and 10 years. (See also W75-01961) (Sims-ISWS)

A HYDROLOGICAL ASSESSMENT OF PRECIPITATION IN THE WESTERN HIGHLANDS OF NEW GUINEA,
Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
E. M. Shaw.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 532-543, 1973. 3 fig, 4 tab, 8 ref.

Descriptors: *Rainfall intensity, *Frequency analysis, *Duration curves, Data processing, Rainfall, Areal, Design storm, *Precipitation(Atmospheric), Hydrology, Tropical regions.
Identifiers: *New Guinea.

Estimates of the frequency of high intensity falls and their areal distribution were required during a feasibility study for a land drainage scheme in an intermontane plateau in New Guinea at an altitude of about 1500 m above sea level and with an average annual precipitation of 2600 mm. With the available short-period autographic data and an eighteen-year daily record, depth-duration-frequency curves were established for rainfall at a point. The maximum daily fall recorded in the area is 102 mm, very low in comparison with other regions in the territory. Some tentative explanations were given. The determination of areal rainfall from point measurements was approached in several ways and an average reduction factor of 75% was found for an area of about 420 sq km, assuming a maximum point storm of 102 mm. A HYBRID COMPUTER SIMULATION MODEL FOR PREDICTING THE EFFECTS OF THE AREAL DISTRIBUTION OF PRECIPITATION ON RUNOFF CHARACTERISTICS,
Utah Water Research Lab., Logan.
E. K. Israelsen, and J. P. Riley.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 552-564, 1973. 5 fig, 5 tab, 3 ref.

Descriptors: *Model studies, *Computer models, Rainfall-runoff relationships, *Precipitation(Atmospheric), Watersheds(Basins), Distribution patterns, Mountains, *Utah, Hydrology, *Simulation analysis, *Forecasting.

A distributed parameter hydrologic model based on fundamental relationships, several of which are non-linear, was described. Spatial resolution was achieved by subdividing the modeled area and by applying average values of model parameters within each subzone. Input data for each subzone consisted of precipitation, temperature, and physical characteristics (slope, soil type, rooting depth, and vegetative cover). The snow accumulation and ablation processes were also considered. Presumably, through weather modification procedures it is possible to alter and control the distribution of precipitation on a watershed. To demonstrate its ability to predict the effects of aerial distribution of precipitation on runoff characteristics, the model was applied to a watershed within the Wasatch Mountains of northern Utah. Telemetered precipitation stations are distributed throughout the area. The computer model predicted actual runoff patterns and simulated runoff patterns under assumed patterns of precipitation distribution. (See also W75-01961) (Sims-ISWS)

INADVERTENT RAIN MODIFICATION AS INDICATED BY SURFACE RAINCELLS,
Illinois State Water Survey, Urbana.
P. T. Schickedanz.
Journal of Applied Meteorology, Vol 13, No 8, p 891-900, December 1974. 1 fig, 6 tab, 26 ref.

Descriptors: *Local precipitation, *Weather modification, *Weather patterns, Rainfall disposition, Rainfall intensity, Rain gages, Artificial precipitation, Topography, Statistical methods, Illinois, *Missouri.
Identifiers: *Raincells, *Urban rainfall, *St. Louis(Mo), Wood River(Ill), Urban effects.

Rainfall data from a large dense network are being used to study inadvertent rainfall modification in the St. Louis area. Surface raincells are delineated and then analyzed to determine the character of any urban-induced changes in precipitation. Results for comparisons of 605 potential effect cells and 870 non-effect cells from the summer of 1971-72 provide strong evidence that cell characteristics have been sizeably altered by the local urban-industrial environment. For cells occurring in the urban-industrial zone of St. Louis, the average rainfall volume was 176% greater than for cells in the control sample. For cells occurring in the separate industrial region of Wood River, the average volume was 262% greater than the cells in the control sample. The results show that the primary change in St. Louis cells is total rain area, and this and other results suggest that the change relates to dynamic effects induced by the urban heat island. The primary change in Wood River cells is in rain intensity, and this and other results suggest that this relates to microphysical effects from the industrial aerosols and additions of moisture into the atmosphere, particularly in dry summers. FREQUENT OCCURRENCE OF HEAVY RAINFALL ALONG THE NORTH SIDE TO THE LOW-LEVEL JET STREAM IN THE BAIU SEASON,
Meteorological Research Inst., Tokyo (Japan).
T. Akiyama.
Papers in Meteorology and Geophysics, Vol 24, No 4, p 379-388, December 1973. 8 fig, 10 ref.

Descriptors: *Rainfall, *Excessive precipitation, Convection, Winds, Distribution patterns, Jets, Clouds.
Identifiers: *Japan, Baiu front.

The relationship between the heavy rainfall and the low-level jet stream was examined over southwest Japan throughout the Baiu season of 1968. As for the spatial relation, it was concluded that the occurrence of heavy rainfall is mostly confined within the zone about 200 km wide along the north side of the low-level jet axis. The wind speed in the heavy rainfall zone is almost vertically uniform in the thick convective layer while the geostrophic wind speed increases with height. This characteristic wind profile suggests that the intensification of the super geostrophic low-level jet is to be attributed to convective momentum mixing. These observational facts about the relation between the heavy rainfall and the low-level jet were explained by the dynamic model of the low-level jet circulation proposed by Matsumoto and Ninomiya (1971). DIURNAL VARIATIONS IN CLOUD CONDENSATION NUCLEI,
State Univ. of New York, Albany. Atmospheric Sciences Research Center.
T-F. D. Lee, and J. E. Jiusto.
Journal of Geophysical Research, Vol 79, No 36, p 5651-5656, December 20, 1974. 4 fig, 1 tab, 11 ref. NSF Grant GA-12735.

Descriptors: *Nucleation, *Condensation, *Cloud physics, Clouds, *Diurnal distribution, Coagulation, *New York, Aerosols, On-site investigations.
Identifiers: *Aitken nuclei, Thermal gradient diffusion chamber.

An increase in the concentration of cloud condensation nuclei at night has been reported frequently in recent years in Australia. An experiment was conducted in New York to determine if and why an evening increase in cloud condensation nuclei might occur. Such a cloud condensation nuclei nocturnal peak was observed over one third of the time and preliminary results suggested that coagulation of smaller Aitken nuclei might be a responsible mechanism. RAINDROP CHARACTERISTICS IN SOUTH CENTRAL UNITED STATES,
Agricultural Research Service, Baton Rouge, La.
C. E. Carter, J. D. Greer, H. J. Braud, and J. M. Floyd.
Transaction of the American Society of Agricultural Engineers, Vol 17, No 6, p 1033-1037, November-December 1974. 6 fig, 1 tab, 18 ref.

Descriptors: *Raindrops, *Impact(Rainfall), Erosion, Rates, Rainfall intensity, Energy, Particle size, *Louisiana, *Mississippi, Central U.S., *Gulf Coastal Plain.
Identifiers: *Soil loss, Drop-size distribution, Kinetic energy, Universal soil loss equation, Flour pellet method.

Raindrops were measured by the flour-pellet method to determine why the universal soil loss equation overpredicted erosion along the Gulf Coast. Raindrops measured in Baton Rouge, Louisiana, were not significantly different in size from those measured in Holly Springs, Mississippi. Differences were indicated, however, between raindrop sizes in these two south central states and those measured in Washington, D.C. Median raindrop sizes increased with increasing rainfall intensities up to approximately 2.5 inches per hour then decreased as rainfall intensities increased further. The decrease in median drop sizes at intensities above 2.5 inches per hour was attributed to raindrops breaking into smaller drops as they approached the unstable size of approximately 6.2 mm in diameter. A cyclic relationship between median raindrop size and rainfall intensity was indicated by median drops increasing again in size with increasing rainfall intensities above 8 inches per hour. Such a relationship is reasonable due to : (1) raindrops increasing in size by coalescence, and (2) raindrops decreasing in size by breaking into smaller drops when they reach an unstable size. Kinetic energy values calculated from the south central states data were in close agreement with those presently used in the soil loss equation at low rainfall intensities (3 inches per hour and less). However, for higher intensities (7 to 8 inches per hour), kinetic energies used in the soil loss equation were as much as 50% greater than values obtained for the south central states. (Jones-ISWS)

AN ASSESSMENT OF WARM FOG - NUCLEATION, CONTROL, AND RECOMMENDED RESEARCH,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering; and Colorado State Univ., Fort Collins. Dept. of Atmospheric Science.
M. L. Corrin, J. R. Connell, and A. J. Gero.
Report No NASA CR-2477, p 143, November 1974. 11 fig, 15 tab, 229 ref, append. NASA NAS8-29583.

Descriptors: *Fog, *Nucleation, Coalescence, Instrumentation, Turbulence, Surface tension, Optical properties, Condensation, Aerosols, Air circulation, Weather modification.
Identifiers: *Fog microphysics, Visibility, Surface films, Drop-size distribution, Liquid water content, Warm fog modification.

A state-of-the-art survey of warm fog research which has been performed up to, and including, 1974 was presented. Topics covered were nucleation, growth, coalescence, fog structure and visibility, effects of surface films, drop size spectrum, optical properties, instrumentation, liquid water content, and condensation nuclei. Included was a summary of all reported fog modification experiments. Additional data were provided on air flow, turbulence, a summary of recommendations on instruments to be developed for determining turbulence, air flow, etc., as well as recommendations of various fog research tasks which should be performed for a better understanding of fog microphysics. ATMOSPHERIC MOISTURE PARAMETERIZATION,
Environmental Technical Applications Center, Washington, D.C.
R. D. Smith.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-784 814, $3.75 in paper copy, $2.25 in microfiche. USAFETAC TN 74-1, p 21, January 1974. 15 fig, 6 tab, 25 ref.

Descriptors: *Cloud physics, Weather modification, Thermodynamics, Convection, Condensation, Fog, Clouds, Atmosphere, *Moisture content, Model studies, Temperature, Measurement, Reviews.
Identifiers: *Atmospheric moisture, Liquid state, Solid state, Cloud droplet size distribution, Droplet terminal velocity, Vertical motion, Stratus clouds, Cumulus clouds, Atmospher.

The development of theoretical and empirical means of measuring atmospheric moisture in both the liquid and solid state was reviewed. The relationships developed for moisture parameterization result in the best estimate of liquid and solid water at a point in time and space. These parameterizations are to be used in modeling the distribution of atmospheric moisture by applying nephanalysis and the more conventional parameters from actual and historic three-dimensional data bases. (Jones-ISWS)

AUTOMATION OF THE COLLECTION AND ANALYSIS OF SCIENTIFIC INFORMATION IN THE PROBLEM OF THE INTERACTION OF THE ATMOSPHERE AND OCEAN,
Linguistic Systems, Inc., Cambridge, Mass.
NASA TT F-801, p 185, November 1974, Translated from Avtomatizatsiya sbora i analiz nauchnoy informatsii v probleme vzaimodeystviya atmosfery i okeana, Vol 301, Hydrometeorological Press, Leningrad, 1972, 140 p Borisenkov, Ye P, and Dyubkin, I A, editors.

Descriptors: *Oceanography, *Meteorology, *Model studies, *Data processing, Research equipment, Ships, Instrumentation, Air circulation, Ocean circulation, Theoretical analysis.
Identifiers: Scientific research vessels.

This collection contains material from research into the interaction of the atmosphere and the ocean, including both experimental research conducted aboard scientific research vessels, and work of a theoretical nature. A number of articles are devoted to the principles basic for a ship automated system that collects and analyzes oceanological data. The theoretical articles deal with the basic concepts of hydrodynamic models of atmospheric and oceanic circulation. (See W75-04730 thru W75-04741) (Sims-ISWS)

THE PROBLEM OF CALCULATING CLOUD COVER IN CALCULATIONS OF LONG WAVE RADIATIONAL CHARACTERISTICS OF THE ATMOSPHERE,
Z. P. Galakhov.
In: NASA TT F-801, p 159-168, November 1974. 3 fig, 11 ref.

Descriptors: *Cloud cover, *Radiation, *Thermal radiation, *Atmosphere, Mathematical models, Model studies, Data processing, Meteorology.

The results of calculating the fluxes of outgoing long wave radiation, taking cloud cover into account, on the basis of mean monthly data were discussed. A three-level and a nine-level model of the atmosphere were used, the nine-level with a one-hundred millibar level as upper limit. Data used in the calculations were collected over many years. (See also W75-04729) (Sims-ISWS)
W75-04740

RECONSTRUCTING THE VERTICAL PROFILE OF HUMIDITY ON THE BASIS OF THE VERTICAL PROFILE OF TEMPERATURE,
T. I. Bazlova.
In: NASA TT F-801, p 169-181, November 1974. 2 fig, 3 tab, 9 ref.

Descriptors: *Humidity, *Temperature, *Model studies, Altitude, Meteorology, Absorption, Radiation, Atmosphere.
Identifiers: *Vertical distribution.

The vertical profile of humidity in the atmosphere was developed on the basis of the vertical profile of temperature by using an empirical formula linking changes in humidity with changes in temperature and altitude. The atmosphere was divided into three layers by altitude because the conditions for the formation of humidity varies with altitude. (See also W75-04729) (Sims-ISWS)

THE OBJECTIVE ANALYSIS OF RELATIVE HUMIDITY,
British Meteorological Office, Bracknell (England).
M. J. Atkins.
Tellus, Vol 26, No 6, p 663-671, 1974. 8 fig, 4 ref.

Descriptors: *Forecasting, *Rainfall, *Humidity, Rainfall intensity, Precipitation(Atmospheric), Meteorology, Model studies, Mixing, Methodology.
Identifiers: Mixing ratio, Primitive equation model, United Kingdom, *Weighting functions(Analysis).

A method of objective analysis of relative humidity was described which makes use of non-isotropic weighting functions. These depend on the gradient of the background field in such a way that observations in a direction along closely packed isopleths have higher weight than those in a direction perpendicular to them. Rainfall predictions with the United Kingdom fine mesh 10-level model were found to be better when based on this humidity analysis than on one using isotropic weighting functions and the results for a particular case were described. The use of surface observations in the lowest layer of the model was discussed and it was shown that it is better to use the surface humidity mixing ratio rather than the surface relative humidity. Resulting forecasts of rainfall are better and do not exhibit the diurnal variations found when using surface relative humidity observations. (Jones-ISWS)

FRONTAL MOTION IN THE ATMOSPHERE,
Tel-Aviv Univ. (Israel), Dept. of Mathematical Sciences.
E. Turkel.
Tellus, Vol 26, No 6, p 630-637, 1974. 8 fig, 14 ref.

Descriptors: *Fronts(Atmospheric), Numerical analysis, Meteorology, Model studies, Equations, Flow, Storms, Boundaries(Surfaces), Air circulation, Equations, *Atmosphere.
Identifiers: *Equations of motion(Atmospheric), Velocity vector.

The motion of frontal disturbances in the atmosphere was studied with a one layer non-linear model proposed by Stoker. The equations of motion were integrated in the interior of the domain by a two step method. Flows resulting from various initial and boundary conditions were considered for considerably longer times than those previously computed. The boundary was followed by a numerical procedure that allows for arbitrary shapes of the front. Hence, flows can be followed until occlusion occurs and the effects of the various initial and boundary conditions on the occlusion process can be accurately compared. In all cases, the cold front propagates faster than the warm front and a relatively strong mass convergence region exists behind the cold front. A cyclonic circulation pattern is clearly visible near the cold front. These facts suggest the occurrence of severe storms associated with cold fronts but not with warm fronts. (Jones-ISWS)

TRICKLE IRRIGATION SOIL WATER POTENTIAL AS INFLUENCED BY MANAGEMENT OF HIGHLY SALINE WATER,
Utah State Univ., Logan.
P. Tscheschke, J. F. Alfaro, J. Keller, and R. J. Hanks.
Soil Science, Vol 117, No 4, p 226-231, April, 1974. 1 tab, 5 fig, 5 ref.

Descriptors: *Soil water, *Saline water, *Irrigation, *Irrigation practices, Soil profile, Leaching, Hydraulic gradient, Evapotranspiration, Irrigation water, Salts, Root zone, Irrigation efficiency.
Identifiers: *Trickle irrigation.

Soil water patterns in soil profiles, subjected to four different trickle irrigation management treatments with highly saline water were investigated. The irrigation treatments on cherry tomato plants were (a) daily with a volume of water equal to that used by the plant the previous day, (b) every other day with equal volumes of water (c) below, and (d) above the volume of water evapotranspired. Generally, the soil water potential decreased in the soil profile, as a result of salt accumulation, with increased distance from the trickle source. The highest salt concentration occurred in the profiles irrigated with volumes of water below that evapotranspired by the tomato plants, indicating the importance of avoiding under-irrigation when-

ever highly saline water is used with trickle irrigation. Higher soil water potentials and higher yields resulted from irrigating with volumes above the evapotranspiration rate. (Mastic-Arizona)

HAIL AND ITS DISTRIBUTION,
Army Engineer Topographic Labs., Fort Belvoir, Va. Earth Sciences Div.
L. Williams.
Army Engineer Topographic Laboratories, Fort Belvoir, Virginia, Special Report ETL-SR-73-3. 16 p, January, 1973. 4 fig, 1 tab, 26 ref.

Descriptors: *Hail, *Precipitation(Atmospheric), *Ice, *Ice stones, Frequency, Probability, Convection, Distribution patterns, Seasonal.
Identifiers: Hailstorms, Hailstorm distribution.

Hail may occur in regions from the tropics to the polar zones, but the principal world occurrence belt is 30 degrees N to 50 degrees N latitude. The number and severity of hailstorms and their duration can vary widely from year to year. Hailstorms move fairly rapidly; durations average from 3 to 5 minutes. Hail falls in streaks and may combine with several other streaks to cover a continuous and broad swath of ground. Over continental areas, hail activity generally peaks in the late spring and early summer with some areas experiencing a secondary peak in the fall. Being a convective system, hailstorm activity tends to peak in midafternoon to early evening. Probability of occurrence of hailstones ranging from a record 5.6 inches in diameter to 0.25 inches are included for guidance of design engineers. (Mastic-Arizona)

V. D. Komarov, A. A. Kharshan, and V. M. Muchin.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 111-116, 1973. 1 fig, 3 ref.

Descriptors: *Precipitation(Atmospheric), *Snowfall, *Mountains, Hydrology, Photography, Snowmelt, Snowpacks, Mountain forests, Slopes, Snow cover, Snow surveys, Satellites(Artificial), Water equivalent, Melt water, Water resources, River basins.
Identifiers: *Snow courses, Snow stakes, *USSR.

The procedures for making estimates of the amount of melt water to be expected from mountain watersheds were described. The methods include prescribed snow courses with fixed points of measurement where means of snow depth and density are determined. The average distance between measuring sites varies from 2-10 km with a maximum difference of 15-200 m in height between sites along the same course. The frequency of measurement is on the order of 3-4 times during the winter. Approximately 200 mountain basins are now surveyed in the Soviet Union. Where necessary, helicopters are used to reach inaccessible watersheds. The helicopters are used to read or photograph snow stakes previously set along a snow course. The use of meteorological satellites shows promise for studying the dynamics of snow coverage of the mountains and the snow line altitude. The water equivalent of snow increases with altitude up to the upper boundary of the forest, but decreases above the tree line. The snow pack also decreases with altitude in barren zones. The water equivalent is found by summing the products of the site water equivalent and the areas that they represent. Other formulas are used when snowpack values are unreliable. DEFICIENCIES IN MEASURED SNOW PRECIPITATION IN A MOUNTAINOUS AREA IN NORWAY,
Norwegian Water Resources and Electricity Board, Oslo (Norway).
O. G. Gjorsvik.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 466-473, 1973. 3 fig, 2 tab, 1 ref.

Descriptors: *Snow, *Water balance, *Precipitation(Atmospheric), Watersheds(Basins), Mountains, *Measurement, Runoff, Snowpacks, Instrumentation, Melt water, Winter, Winds.
Identifiers: *Norway.

Observations of runoff and precipitation in the Groset area, Norway, showed considerable deficiencies in measured precipitation. The basin has an area of 5.91 sq km and a mean altitude of 990 m ASL. A water balance for the period 1949-1968 was established, based on observations of precipitation (3 stations), runoff, groundwater stage, and snow surveys. A 'true precipitation' was calculated for the winter season from measurements of the snow storage and runoff, and the calculated groundwater runoff. The ratio between this true precipitation and the observed precipitation in Norwegian standard gages was estimated at 1.51. This means that the precipitation gages in the Groset area are able to catch, on the average, 66% of the snow precipitation. (See also W75-01961) (Sims-ISWS)

SIMPLE ALBEDO FEEDBACK MODELS OF THE ICECAPS,
National Oceanic and Atmospheric Administration, Princeton, N.J. Geophysical Fluid Dynamics Lab.
I. M. Held, and M. J. Suarez.
Tellus, Vol 26, No 6, p 613-629, 1974. 10 fig, 21 ref, 3 append. NOAA Grant 04-3-00233 and NSF Grant GA-40341.

Descriptors: *Ice, *Albedo, *Mathematical models, *Glaciology, Model studies, Theoretical analysis, Analytical techniques, Mathematics, Equations, Circulation, Air circulation, Ocean circulation, Solar radiation, Climates, Ice cover, *Variability.
Identifiers: *Diffusive models, Linear diffusive models, Non-linear diffusive models, Global climates, Perturbation theory, Obliquity variations.

A series of simple models of the albedo feedback mechanism and its effect on the global climate were solved analytically. All of the models are similar to one considered by Budyko. The seasonal variation in incident solar radiation was ignored. Emphasis was placed on the parameter dependence of the models' sensitivity to changes in the solar constant. It was found in all cases that increasing the efficiency of the poleward transport of energy increases this sensitivity. It was suggested that knowledge of the partitioning of the transport between the atmosphere and the oceans is of considerable importance for estimating sensitivity. The stability of equilibrium states was determined from the properties of small perturbations away from equilibrium. It was observed that relaxation times of perturbations can be increased considerably by the albedo feedback mechanism. The effect of variations in the obliquity of the planet's orbit on sensitivity and stability was also analyzed. The results indicate that albedo feedback may increase the significance of obliquity variations on Mars, as well as on Earth. (Humphreys-ISWS)

SILICON CONTENT OF WHEAT HUSKS IN RELATION TO WATER TRANSPIRED,
Commonwealth Scientific and Industrial Research Organization, Glen Osmand (Australia). Div. of Soils.
J. T. Hutton, and K. Norrish.
Aust J Agric Res Vol 25, No 2, p 203-212, 1974. Illus.
Identifiers: Equations, Fertilizers, Growth rates, Nitrogen, Silicon hydroxide, *Wheat, *Transpiration.

Si concentrated in the husks, is about 1/3 of the total Si in the plant, and so the husks were used for transpirational measurements. Samples, from field trials extending over several seasons and from a number of localities, showed that the percent Si in the husks is closely related to water transpired. The equation, water used (cm) = 7.4 + 4.6 (% Si) ($r = 0.99$, $n = 8$), should be applicable to most of the wheat-growing areas of southern Australia, but the addition of fertilizers, particularly N, modifies the equation. The relationship between weight of Si in the tops and water transpired is consistent with the known solubility of $Si(OH)_4$ in soils, but the correlation is poorer than that using percentage Si.—Copyright 1974, Biological Abstracts, Inc.

A METHOD FOR MEASURING FIRST-STAGE SOIL WATER EVAPORATION IN THE FIELD,
Agricultural Research Service, Temple, Tex. Blackland Conservation Research Center.
G. F. Arkin, J. T. Ritchie, and J. E. Adams.
Soil Science Society of America Proceedings, Vol 38, No 6, p 951-954, November-December, 1974. 5 fig, 8 ref.

Descriptors: *Evaporimeters, *Soil moisture, *Evaporation, Transpiration, Drying, Flow rates, Pressure measuring instruments, Measurement, *Evapotranspiration, *Soil water.
Identifiers: Transducers, Evaporation plate.

An economical, automated method was developed for measuring soil water evaporation during first-stage drying simultaneously at several locations in a field to evaluate the effectiveness of mulches and crop canopies in reducing soil water evaporation. The method also provided a reasonable procedure for separating soil water evaporation during first-stage drying from transpiration, when the total evapotranspiration rate was accurately measured. Water flow through a thin evaporation plate with a known surface area was measured and used as a direct indicator of the evaporation rate. Flow rates could be recorded manually or automatically. Field tests of evaporation indicated that the resolution of the system was equal to that of a precision weighting lysimeter and that the system gave reasonable accuracy on an hourly basis. Mulch rates of 1000, 4000, and 10,000 kg/ha reduced daily soil water evaporation measured with this method by 26, 59, and 78% of the bare soil evaporation. Cumulative daily soil water evaporation was reduced by 57 and 71% under plant canopies with 100- and 50-cm row spacings and similar leaf area indices (3.0 and 2.7, respectively). (Roberts-ISWS)

Battelle-Pacific Northwest Labs., Richland, Wash.
J. J. C. Hsieh, L. E. Brownell, and A. E. Reisenauer.
Report No BNWL-1711, p 56, 1973. 8 fig, 2 tab, 1 ref, 4 append.

Descriptors: *Lysimeters, *Neutron absorption, Moisture content, *Meteoric water, Soil water, Vadose water, Measurement, *Path of pollutants, Water pollution sources.
Identifiers: Neutron meters, Psychrometers, Thermocouples.

Two large lysimeters were installed in the soil of the Hanford Reservation to gather data on the accumulation and penetration of meteoric water. The construction details of the experiment were described. The soil hydraulic characteristics and data collected for the first 6 months were included. One of the lysimeters was constructed with a closed bottom to prevent interchange of moisture with the vadose zone. If annual precipitation exceeded annual evapotranspiration, the moisture content near the bottom of this lysimeter would have increased. An open bottom lysimeter was constructed to provide data to support the results obtained from the closed lysimeter. Each was 3 meters diameter and 18.3 deep and filled with well-mixed local soil. Each had three tubes to accomodate neutron probes, psychrometers and thermocouples for water potential and soil temperature measurements, and tubes for measuring atmospheric pressure at various depths. RELATIVE RATES OF FLOW OF THE NEGRO AND SOLIMOES RIVERS (DETERMINED) THROUGH O18 CONCENTRATIONS, (IN PORTEGUESE),
Centro de Energia Nuclear na Agricultura, Sao Paulo (Brazil).
E. Matsui, E. Salati, W. L. F. Brinkmann, and I. Friedman.
Acta Amazonica, Vol 2, No 3, p 31-46, 1972, Illus.
Identifiers: *Brazil, *Flow rates, Mixing, Negro River, *Oxygen-18, Rivers, Solimoes River, Isotopic concentration.

Isotopic concentration was measured in different spots of the Rio Negro, Rio Solimoes and Rio Amazonas (Brazil) at regular intervals f 12 consecutive months. Values as found in Rio Negro waters were significantly different from the others. Difference between isotopic concentration found in Rio Negro and Rio Solimoes is useful information for identifying the spot where the Rio Amazonas, formed by the confluence of the Negro and Solimoes, presents a homogenous vertical and horizontal structure after complete mixing of both rivers. A perfect mixture was not found up to 120 km below the confluence. Systematic sampling is a method for the determination of relative outflow of both rivers. The data are close to the results of direct measurements performed by Oltman et al.--Copyright 1974, Biological Abstracts, Inc.

RIVER REGIME WITH SPECIAL REFERENCE TO RIVER NILE,
Assiut Univ. (Egypt).
M. B. Khalil.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY1, Proceedings Paper 11072, p 135-153, January 1975. 15 fig, 1 tab, 34 ref, 2 append.

Descriptors: *Regime, *Sedimentation, *Stability, *Channel morphology, *Canals, *River flow, Hydraulic similitude, Dimensional analysis, Hydraulic design, Streams, Particle size.
Identifiers: *Nile River Valley, Silt factor, Laceys regime theory.

A review of canal systems in India and the United States showed that when the variables of flow area, surface slope, and flow velocity are considered proportional to some power of discharge, the value of the exponent of a variable for various canal systems is essentially the same. However, the coefficient of proportionality varies and this variation is attributed to variation in sediment parameters. Natural rivers are irregular and less predictable in their behavior. The exponents of the rate of flow of water for the three variables for natural rivers vary more about the mean value than for the canals. The average slope computed at gaging stations on the Nile and its tributaries varied from 1.53 to 100.0 times 100,000. The relationship between discharge and water depth was analyzed. The water depth was proportional to discharge raised to the 2/5 power. The scatter of observations about the mean line was explained by seasonal filling of the bed with sediments, variation in water slop and sediment concentration, and changes in bed configuration and roughness. For the Nile River, the silt and flow equations seem sufficient to describe the channel geometry. (Singh-ISWS)

Descriptors: *Hydrograph analysis, *Evapotranspiration, Recession curves, Runoff, Precipitation(Atmospheric), Streams, Hydrographs, Theoretical analysis.
Identifiers: *Recession limb, Recession flows.

The structure of discharge-recession curves was investigated starting with a 1939 reference that states that the recession limb of a hydrograph is comprised of surface runoff, interflow, and groundwater components in variable proportions with the surface runoff component close to the hydrograph peak. The exponential equation developed in the 1939 paper would produce a

unique recession curve for every watershed. observations differ from this theory because evapotranspiration losses from a watershed are seasonal and have a variable effect on the slopes of recession curves. The premise was that the streamflow recession reflects watershed physical characteristics so that each watershed has its unique recession curve. The recession equation of 1939 was modified to permit the synthesis of the watershed standard curve given an observed recession curve for the watershed and evapotranspiration loss rates during the recession period. An equation was developed that permitted the routing of subsurface flow while simultaneously adjusting the routed recession for evapotranspiration losses. (Roberts-ISWS)

SURFACE WATER DATA OF THE LLANO TEXAS REGION, PROJECT SANGUINE.
EDAW, Inc., San Francisco, Calif.
Available from the National Technical Information Service, Springfield, Va. 22161 as AD-780 254. Paper copy $3.75, microfiche $2.25. November 1973. 38 p, 1 tab, 23 ref, 3 append. Contract N62472-73-C-1056.

Descriptors: Hydrology, *Rainfall, *Runoff, Topography, Surface waters, Streams, Drainage, Discharge measurement, Streamflow, Cross-sections, *Texas, Water quality, Colorado River, On-site data collections.
Identifiers: San Saba River(Tex), Llano River(Tex), Pedernales River(Tex).

The only large streams that cross the Llano, Texas study area are the southward-flowing Colorado River and its three eastward-flowing tributaries - the San Saba, Llano, and Pedernales Rivers. The study area is located on a relatively old geologic/topographic surface with a highly developed stream net. This type of drainage, along with climatic conditions that include sporadic periods of heavy rainfall, results in 'flashy' stream performance. The quality of the water in streams in the area is generally good, but it is quite hard. The Llano River at low flow has a TDS of only about 250 ppm, while perennial tributaries have a TDS of 350 ppm. Bedrock is shallow and the streams do not scour to great depths. Surface water is diverted and pumped for irrigation and used as a municipal water supply in a few cities. Water quality does not appear to have deteriorated within the period of measurement and it will not change unless large quantities of waste water are discharged into the streams. (Dawes-ISWS)

2F. Groundwater

RADIOCARBON, CARBON-13 AND TRITIUM IN WATER SAMPLES FROM BASALTIC AQUIFERS AND CARBONATE AQUIFERS ON THE ISLAND OF OAHU, HAWAII,
Hawaii Inst. of Geophysics, Honolulu.
T. H. Hufen, R. W. Buddemeier, and L. S. Lau.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 410, $3.25 paper copy, $2.25 microfiche. Paper IAEA/SM-182/33, presented at International Atomic Energy Agency Symposium, Vienna, Australia. February 1974. 18 p, 5 fig, 2 tab, 15 ref. OWRT B-030-HI(1), 14-31-0001-3875.

Descriptors: *Hawaii, *Water sampling, *Carbon radioisotopes, Groundwater, Age, *Groundwater movement, Isotopes, *Tritium, Confined water, Aquifers, Carbonates, Pumping, Recharge, Basalts, Piezometry.
Identifiers: *Carbon-13, Basal groundwater, *Basaltic aquifers, Liquid scintillation counting, *Oahu(H.I.), *Carbonate aquifers.

Principal fresh water aquifers on the subtropical island of Oahu consist of basaltic rocks that are devoid of fossil carbonate minerals. In southern Oahu fresh water occurs as semi-independent basal lenses which float on salt water and are bounded by sedimentary formations along the coast and in valley bottoms. The latter formations contain carbonate aquifers. Fresh water also occurs in dike compartments located in the central parts of the mountains. The radiocarbon content of groundwater recharge on Oahu is between 96 and 100% modern. The carbon-13 concentration associated with fresh groundwater is between -17 and -19 deviations per mil from the PDB standard, and remains constant while such waters reside in, or travel through, basaltic rock aquifers. Radiocarbon and tritium data on basal waters withdrawn by major pumping stations show these waters to have ages between a few decades and several hundred years. Differences in these ages relate systematically to individual pumping rates of the stations, well depths and local lens thickness.

CONTROLS ON THE QUALITY VARIATIONS OF SOME CARBONATE SPRING WATERS,
Goettingen Univ. (West Germany). Sediment-Petrographisches Institut.
R. L. Jacobson, and D. Langmuir.
Journal of Hydrology, Vol 23, No 3/4, p 247-265, December 1974. 10 fig, 5 tab, 29 ref.

Descriptors: *Geochemistry, *Carbonate rocks, *Springs, *Hydrogeology, Discharge(Water), Spring waters, Water chemistry, Geologic control, Solutes, Subsurface runoff, Dissolved solids, Infiltration, Groundwater movement, Hydrographs, Storms, Recharge, Specific conductivity, Equilibrium, Statistics, *Pennsylvania, *Water quality control.
Identifiers: *Nittany Valley(Pa), Diffuse flow, Conduit flow.

In carbonate-rock terranes i central Pennsylvania, a spring's discharge characteristics and water chemistry can be predicted from its geographic and hydrogeologic setting. Springs located near non-carbonate ridges (conduit-type) receive much of their recharge as mountain runoff entering sinkholes, have waters low in solutes, and have a large variability in water quality and discharge. Springs in mid-valley areas (diffuse-type) receive water chiefly by infiltration through soils, or from a deeper circulating groundwater flow system, and discharge water with higher total dissolved solids (TDS) and less variation in solute amounts and discharge. A spring's flow is a much more important control on its water chemistry than is season, particularly for diffuse-type springs. In conduit spring waters, TDS increase in the early part of the storm hydrograph, decrease during the middle of the storm peak because of recharge via sinkholes, and finally increase as the storm pulse dissipates. In diffuse spring waters TDS increase and decrease nearly simultaneously with discharge following a storm as infiltration through soils near the spring leaches salts to the groundwater table. Based on precipitation and discharge records, it took 6 and 60 days, respectively, for 50% of the groundwater introduced following a storm to leave a conduit and a diffuse type spring system. DISTRIBUTION OF DIFFERENT FORMS OF NITROGEN IN SOME DESERT SOILS,
California Univ., Los Angeles.
H. Nishita, and R. M. Haug.
Soil Science, Vol 116, No 1, p 51-58, July, 1973. 6 tab, 35 ref.

Descriptors: *Nitrogen, *Nitrification, *Deserts, *Vegetation effects, Nitrogen fixation, Nitrogen compounds, Soil chemical properties, Alkalinity, Organic compounds, Inorganic compounds.

Several desert soils were studied to determine the contents and distributions of different forms of nitrogen. Soil profiles were sampled in 7.6 cm increments to various depths with a maximum depth of 91.4 cm. All of the soils examined were of alkaline reaction since nitrification is favored by a pH above neutral. Total nitrogen was greatest in the surface layer (0.0-7.6 cm.) and usually decreased sharply in the second layer. The order of the different nitrogen forms in the surface layers of soils was (organic N)>(fixed NH4+-N)>(NO3--N)>(extractable NH4+-N)>(NO2--N). The fixation of NH4+-N was lower in the soil under plants than in the bare soil. The nitrogen content in the soil was influenced by plant species. (Mastic-Arizona)

CALCULATION OF THE DRAINAGE COMPONENT OF SOIL WATER DEPLETION,
Agricultural Research Service, Prosser, Wash.
D. W. Miller, and J. S. Aarstad.
Soil Science, Vol 118, No 1, p 11-15, July, 1974. 1 tab, 2 fig, 9 ref.

Descriptors: *Evapotranspiration, *Soil water, *Drainage, *Irrigation, Soil texture, Field capacity, Soil water movement, Wetting.
Identifiers: Soil water depletion.

The relationship between soil water content and drainage was studied under conditions of no evapotranspiration. Drainage was calculated for a range of evapotranspiration rates under the assumption that for a given cropped soil, the drainage rate was a function of water content and independent of water uptake by plants. A close correlation between measured and calculated soil water depletion was obtained with three soils ranging in texture from sand to silt loam and at transpiration rates of 0.4 to 1.3 centimeters per day. The proportion of total depletion due to evapotranspiration increases as evapotranspiration increases. (Mastic-Arizona)

W75-04374

INFILTRATION FOR THREE RANGELAND SOIL-VEGETATION COMPLEXES,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center; and Soil Conservation Service, Phoenix, Ariz.
J. R. Tromble, K. G. Renard, and A. P. Thatcher.
Journal of Range Management, Vol 27, No 4, p 318-321, July, 1974. 3 tab, 2 fig, 8 ref.

Descriptors: *Infiltration, *Grasses, *Rainfall simulators, *Soil-water-plant relationships, *Watershed management, Infiltrometers, Runoff, Brush, Grazing, Arizona, Hydrologic properties, Soil types, Soil surfaces.
Identifiers: Walnut Gulch Experimental Watershed.

A rainfall simulator was used to examine infiltration-runoff relations as influenced by three typical soil-vegetation complexes on rangeland sites in southeastern Arizona. These sites were selected in order to quantify differences in infiltration and runoff encountered on three major rangeland soil with brush, grass, or no vegetation and to examine infiltration variability encountered on different hydrological soil groups. Soil moisture content was low at all sites as a result of below normal precipitation during the preceeding 4 months. Infiltration was higher on brush than on ungrazed grass plots, and higher on ungrazed grass plots than on grazed grass plots. Infiltration decreased significantly with base soil. On brush-dominated plots more litter was present providing soil conditions more amenable to infiltration. Approximately twice as much crown cover was measured on brush plots as on grass plots providing more soil protection and improving infiltration. (Mastic-Arizona)

THE TEMPERATURE PROFILES OF SOIL COLUMNS DURING INFILTRATION,
Sydney Univ. (Australia). Dept. of Soil Science.
N. Collis-George, and R. Lal.
Australian Journal of Soil Research, Vol 11, No 1, p 93-105, March 1973. 3 tab, 2 fig, 11 ref.

Descriptors: *Infiltration, *Soil moisture, *Heat balance, *Thermal conductivity, *Soil profiles, Temperature, Soil aggregates, *Heat transfer, Isotherms, Thermodynamics, Radiation, Vapor pressure, Condensation, Convection, Diffusion, Water vapor, Wetting.

An attempt was made to gather more quantitative evidence to ascertain the role played by heat of wetting on infiltration behavior in columns of two soil aggregates at two initial moisture regimes. A temperature front produced during infiltration can be divided into zones: (a) a zone of vapor condensation and temperature rise, (b) a zone between (a) and (c) where temperature falls and heat is lost by conduction to the liquid wetting front, and (c) a zone starting at the liquid wetting front and with temperature decreasing to ambient. Mechanisms of vapor diffusion, liquid flow, heat conduction, and heat transport that occur qualitatively explain all observed results. Heat balance procedures are used to show that the thermodynamic heat of wetting obtained from the absorption isotherms is the dominant quantity in each experiment. Results are discussed in terms of infiltration into unstable soils. (Mastic-Arizona)

THE CLASSIFICATION OF SOME NIGERIAN SOILS,
Wisconsin Univ.-Stevens Point.
M. I. Harpstead.
Soil Science, Vol 116, No 6, p 437-443, December, 1973. 1 fig, 3 tab, 15 ref.

Descriptors: *Soil classification, *Soil formation, *Soil structure, *Land use, Soil type, Soil texture, Vegetation, Aeolian soils, Soil physical properties, Soil chemical properties, Soil profiles.
Identifiers: *Nigeria.

Soil profile samples from eleven sites in Nigeria were studied for soil classification. Samples were widely distributed from the high rainfall coastal area of sedimentary parent material to the dry northern area where aeolian deposits from the Sahara Desert have been the major soil forming factor. Soils were classified according to the USDA system of soil classification. Soils with weatherable minerals formed from crystalline rocks were mainly classified as alfisols. Those soils formed from sedimentary rocks and ultrabasic crystalline rocks are oxisols. Soils derived from aeolian parent material and the Pleistocene sediments are classified as inceptosols. Location, soil classification, vegetation, type present, parent material, probable age, and some morphological characteristics are given. This study was undertaken as a basic soil survey to aid in land use planning necessary for meeting the great demand being placed on the soil to meet the food and fiber needs of a rapidly expanding population. OVERSATURATION METHOD FOR PREPARING SATURATION EXTRACTS FOR SALINITY APPRAISAL,
Agricultural Research Service, Chickasha, Okla.
L. E. Allison.
Soil Science, Vol 116, No 2, p 65-69, August, 1973. 3 fig, 1 tab, 5 ref.

Descriptors: *Saturated soils, *Saturation, *Soil water, *Puddling, Salinity, Field capacity, Soil texture, Soil horizons.

A new method for preparing saturated extracts of salt-affected soils is described. Soil saturation is achieved by means of oversaturation rather than from a dry soil. The method offers saving in time and labor of preparing saturated pastes for extraction and analysis. The oversaturation technique offers two main advantages over the standard procedure; it avoids the necessity of repeated adding and mixing of increments of water into a sticky soil mass that develops long before saturation is attained, and it prevents the puddling effect that occurs when fine-textured soils are mixed at a water content near field capacity. An effective test for the end point of saturation and some modern extraction equipment are described. (Mastic-Arizona)

EVALUATION OF THE FILTER PAPER METHOD FOR ESTIMATING SOIL WATER POTENTIAL,
Utah State Univ., Logan.
S. Al-Khafaf, and R. J. Hanks.
Soil Sci, Vol 117, No 4, p 194-199, 1974, Illus.
Identifiers: *Filter paper method, Flow, Liquids, Psychrometers, Soil temperature, Thermocouples, *Soil water potential, Water vapor, Estimating.

The method was calibrated using salt solutions, thermocouple psychrometer, pressure plates and soil columns at equilibrium. The predicted water potential was influenced by the type of contact of the soil with the filter paper. It is suggested that 1 filter paper be placed beneath the soil (good contact for liquid flow and vapor flow) and another above the soil not in physical contact (allowing vapor flow only). The absolute temperature was not too important but temperature variations had a large effect on the producted soil water potential.--Copyright 1974, Biological Abstracts, Inc.

TRICKLE IRRIGATION SOIL WATER POTENTIAL AS INFLUENCED BY MANAGEMENT OF HIGHLY SALINE WATER,
Utah State Univ., Logan.
P. Tscheschke, J. F. Alfaro, J. Keller, and R. J. Hanks.
Soil Sci, Vol 117, No 4, p 226-231, 1974, Illus.
Identifiers: Evapotranspiration, Irrigation, Management, *Saline water, *Soil water potential, Tomato, Transpiration, *Trickle irrigation, Crop production.

Although trickle irrigation offers the possibility of obtaining comparatively good yields when nontoxic highly saline water is used for irrigation, the subsequent accumulation of salts in the root zone is a potential hazard that should not be disregarded. The soil water potential and salt patterns in uniform soil profiles as a result of 4 different water management treatments were determined. Under these treatments cherry tomato plants were irrigated daily with a volume of water equal to that used by the plant on the previous day, every other day with volumes of water equal, below, and above the water evapotranspired. In general, the soil water potential decreased in the soil profile, as a result of salt accumulation, with increased distance from the trickle source. In the profiles where the wetting fronts reached the mid-region between the emitters much lower soil water potentials were measured near the soil surface. The highest salt concentration occurred in the profiles irrigated with volumes of water below that evapotranspired by the tomato plants, indicating the importance of avoiding under irrigation whenever highly saline water is used with trickle irrigation. Higher soil water potentials and higher yields resulted from irrigating with volumes above the evapotranspiration.--Copyright 1974, Biological Abstracts, Inc.

MECHANISM OF FIRE-INDUCED WATER REPELLENCY IN SOIL,
S. M. Savage.
Soil Science Society of America, Proceedings, Vol 38, July-August 1974. p 652-657, 4 tab, 3 fig, 8 ref.

Descriptors: *Litter, *Soil temperature, *Heat, *Burning, Organic compounds, Forest fires, Sands, Volatility.
Identifiers: *Water-repellency, Hydrophobic substances, Thermocouple.

The distribution, chemistry, and reaction of substances released from the organic litter layer as a result of wildfire which creates water-repellent soils were studied. The formation of water-repellent soil can cause serious erosion and delay revegetation of the burned areas. Organic soil litter collected under Manzanita (Arctoslaphylos sp.) was burned over a sand column. In one case the

burned litter was allowed to remain until cool, in the other, the litter was removed at once. Results showed that maximum temperatures were reached when the litter remained. The movement of organic substances occurs during the fire, and after burning heat moves into the sand 'fixing' some of the more polar hydrophobic substances and revolitilizing the less polar substances, thus broadening the water-repellent layer. Temperatures required for these processes appeared to be greater than 250C. (Mastic-Arizona)

SALT AND WATER MOVEMENT IN RELATIVELY DRY SOIL,
Papua and New Guinea Univ., Port Moresby (New Guinea). Dept. of Physics.
D. R. Scotter.
Australian Journal of Soil Research, Vol 12, No 1, March 1974. p 27-35, 6 fig, 11 ref.

Descriptors: *Salts, *Soil water movement, *Diffusivity, Soil moisture, Fertilizers, Gravitational water, Model studies.
Identifiers: *Water potential, Parlange theory.

The Parlange theory of relatively dry soil salt and water movements was studied. Data on water potentials and water and salt diffusivities as functions of water content for the particular soil used are neccessary. When dry crystalline salt is placed on a relatively dry soil, water accumulates in the soil directly adjacent to the salt, and dissolved salt moves into the wetter area. Results show the theory to have some limited success in predicting salt movement into the soil, but to inadequately explain the water distribution in the wetter area adjacent to the crystalline salt. To account for the discrepancy between the measured and calculated water diffusivity, it is suggested that there is significant water movement in the vapor phase which is not accounted for in the theory. THE EFFECT OF INITIAL MOISTURE CONTENT AND INFILTRATION QUANTITY OF REDISTRIBUTION OF SOIL WATER,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
T. Talsma.
Australian Journal of Soil Research, Vol 12, No 1, March 1974. p 15-26, 8 fig, 2 tab, 11 ref.

Descriptors: *Infiltration, *Soil moisture, *Moisture content, *Drainage, *Water distribution, Irrigation, Sands, Loam, Capillary water, Capillary conductivity, Gravitational water, Soils, Transition flow.
Identifiers: Moisture profiles.

Experimental data were obtained to verify several studies that describe the redistribution of water in uniformly moist, inert, porous material, after irrigation has ceased. Initial moisture content and infiltration quantity were studies in loam, fine sand, and coarse sand. Moisture profiles were obtained during redistribution by gamma ray attenuation. Measured values of the hydraulic properties of the soils were used to calculate fluxes at the transition from drainage to wetting. Gravity effects dominated in both sands, while capillary effects at smaller initial moisture contents and infiltration quantities dominated in the loam. In all soils, increased initial moisture quantities or infiltration quantity was directly related to the increased contribution of gravity to the flux, and decreased contribution of capillarity. In any particular material, it depends on the magnitude of these fluxes whether mean moisture contents in the drainage zone will be higher or lower at increasing values of initial moisture content or infiltration quantity. (Mastic-Arizona)
W75-04517

THE EFFECT OF SOIL TEXTURE AND DENSITY ON THE NEUTRON AND DENSITY PROBE CALIBRATION FOR SOME TROPICAL SOILS,
International Inst. of Tropical Agriculture, Ibadan (Nigeria).
R. Lal.
Soil Sci 117(4): 183-190, Illus. 1974.
Identifiers: Calibration, *Density probes, Moisture, *Neutron probes, *Soil texture, Soils, *Tropical soils, Ferrallitic soils, Instrumentation, *Soil density.

The effect of soil texture and bulk density on calibration of neutron moisture and density probes was investigated for 5 tropical ferrallitic soils. Soil texture and bulk density had a significant effect on the neutron probe calibration. Fine-textured soil with high content of extractable Fe had an intercept of 0.465 as compared to 0.044 for coarse-textured soil. For 20% volumetric moisture content the count ratio changed from 0.568 for dry density of 1.0 g cm-3 to 0.943 with twice the value of soil density. Similarly, texture and initial moisture content significantly influenced the density probe calibration. Therefore, widespread heterogeneity of tropical soils limits the usefulness of the neutron-scattering technique as routine method of monitoring soil moisture regimes.--Copyright 1974, Biological Abstracts, Inc.

COMPARATIVE CHANGES IN SOIL-PHYSICAL PROPERTIES INDUCED BY ADMIXTURES OF MANURES FROM VARIOUS DOMESTIC ANIMALS,
California Univ., Davis.
A. A. R. Hafez.
Soil Science, Vol 118, No 1, p 53-59, July, 1974. 7 tab, 2 fig, 9 ref.

Descriptors: *Soil physical properties, *Organic wastes, *Hydraulic conductivity, *Fertilizers, *Farm wastes, Permeability, Bulk density, Soil aggregates, Soil types, Soil texture, Soil strength, Soil water movement, Moisture content, Compaction, Shrinkage, Cattle.
Identifiers: Horses.

Changes in some properties of soils were observed following the addition of manures from domestic animals. Bulk densities were decreased in a fine sandy loam soil. Water holding capacities of both sandy and clay soils were increased in proportion to quantities of manure added. Water flow through saturated soils was dramatically enhanced by the fibrous components of beef cattle and horse manures, whereas poultry manures gave little or no response. Addition of animal manure induced water-stable soil particle aggregation and higher shrinkage limits in a clay soil. Soil strength was reduced progressively with increased rates of admixed manure. There was strong evidence to support the proposition that the fibrosity of manures might have important bearing on the degree of hydraulic conductivity that may be induced in improvements in physical properties in soils, whereas the organic component is mainly responsible for increases in the water holding capacities. A NONDESTRUCTIVE METHOD OF FOLLOWING MOISTURE CONTENT AND TEMPERATURE CHANGES IN SOILS USING THERMISTORS,
Sydney Univ. (Australia). Dept. of Soil Science.
P. M. Cornish, K. B. Laryea, and B. J. Bridge.
Soil Science, Vol 115, No 4, p 309-314, April, 1973. 2 tab, 4 fig, 11 ref.

Descriptors: *Soil moisture, *Soil moisture meters, *Soil temperature, *Thermal conductivity, *Moisture content, Soil structure, Potentiometers, Calibrations, Infiltration, Evaporation, Bulk density, Soil physical properties, Wetting, Instrumentation.
Identifiers: Thermistors, Wheatstone bridge circuit.

Thermistors are embedded directly in the soil, and functioning as both heating elements and sensors, respond to changes in thermal conductivity of the soil as water content changes. The thermistors are used in a Wheatstone Bridge circuit as part of a nondestructive method for following moisture content changes in soil materials. Following calibration for the particular soil material, the method allows moisture contents to be monitored in experiments involving both evaporation and infiltration where changes in bulk density and particle geometry are not extreme. The bridge circuits and thermistors can also be sued to measure soil temperature when the thermistors have been calibrated. (Mastic-Arizona)

THE COMBINED EFFECTS OF INFILTRATION AND REDISTRIBUTION ON LEACHING,
California Univ., Davis.
C. Kirda, D. R. Nielsen, and J. W. Biggar.
Soil Science, Vol 117, No 6, p 323-330, June, 1974. 1 tab, 6 fig, 82 ref.

Descriptors: *Leaching, *Soil water movement, *Infiltration, *Sprinkler irrigation, *Hydraulic conductivity, Chlorides, Soil water, Salts, Hysteresis, Soil surfaces, Rainfall, Irrigation, Soil types, Soil profiles.

Nondestructive measurements were used to examine simultaneous transport of chloride and water for infiltration and redistribution within soil columns. The objective was to evaluate whether water content at the surface and the initial soil water content cause appreciable differences in the leaching process. Water application methods yielding small average soil water contents during infiltration leached the chloride efficiently to relatively great depths. Initial soil water content did not have any appreciable effect on leaching during infiltration, but the smaller the initial soil water content present, the displacement of chloride during redistribution was deeper and more complete. POLYVINYL ALCOHOL AS A STABILIZER OF SURFACE SOIL,
Waite Agricultural Research Inst., Glen Osmond (Australia).
R. C. Stefanson.
Soil Science, Vol 115, No 6, p 420-427, June, 1973. 6 tab, 5 fig, 15 ref.

Descriptors: *Soil surfaces, *Rainfall, *Simultated rainfall, *Soil water, *Biodegradation, Soil stabilization, Plant growth, Organic matter, Soil types, Soil structures, Infiltration, Moisture content, Hydrolysis, Chemical properties, Chemicals.
Identifiers: *Polyvinyl alcohol, PVA.

Polyvinyl alcohol (PVA) is shown to be an effective stabilizer of surface soils when soil organic matter maintains the structural organization of the soil. In three out of four soils studied, rainfall acceptance could be doubled by adding 0.005% w/w of PVA to the 0-2 cm. layer of soil in an undisturbed core. The use of an optimal-sized polymer and application to wet soil improved the efficiency of stabilization. Additional factors that were studied included the effect of the method and rate of application, the molecular weight and degree of hydrolysis of PVA, the importance of soil type, and the effect of plant growth. When the PVA was applied to cores which had recently supported plant growth, the acceptance of rainfall was reduced. PVA appears to be resistant to biodegradation in undisturbed soils, but confirmation with c14 labeled PVA will be necessary. (Mastic-Arizona)
W75-04607

MICROMORPHOLOGY. A DISCIPLINE AT THE CHEMISTRY-MINEROLOGY INTERFACE,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia). Div. of Soils.
R. Brewer.
Soil Science, Vol 115, No 3, p 261-266, March, 1973. 29 ref.

Descriptors: *Soil chemical properties, *Soil chemistry, *Percolation, *Soil water, *Weathering, Microscopy, Mineralogy, Soil profiles, Soil formation, Soil physical properties, X-ray diffraction.
Identifiers: Micromorphology, Microhydrology.

In terms of pedology, micromorphology deals specifically with the study of thin sections of soil materials using a polarized light microscope. Micromorphology can be useful as an intermediate step in chemical-mineralogical studies where the distribution of mineral constituents can be observed and used for interpreting chemical processes. These processes that may be analyzed include, mineral weathering for use in determining chemical histories of soils, concentration of mineral species to interpret specific pedological features in therms of specific chemical processes, and, the effects on profile chemistry to determine the effects of pedological features on soil solutions percolating through, including wetting and drying patters and rates of movement of solutions. This discussion infers that the full potential of micromorphology has not been realized; and that a reason might be the general lack of attempts to correlate microscopic data with chemical and mineralogical data. SIMULATION OF MOISTURE TRANSFER IN SOILS: ONE-DIMENSIONAL INFILTRATION,
Goettingen Univ. (West Germany). Inst. of Soil Science and Forest Nutrition.
R. R. Van der Ploeg.
Soil Science, Vol 118, No 6, p 349-357, December 1974. 3 fig, 2 tab, 8 ref.

Descriptors: *Soil moisture, *Soil water movement, *Infiltration rates, *Unsaturated flow, Computer models, Computer programs, Profiles, Soils, Darcys law, Infiltration, Permeability, Model studies, Evaporation, Moisture content, Water transfer, Simulation analysis.
Identifiers: *Yolo light clay, One-dimensional infiltration.

A simulation program for a digital computer was developed to calculate the soil moisture profile, the infiltration rate, and the cumulative infiltration under conditions of one-dimensional, vertical unsteady infiltration into soil. The simulation program does not require an advanced mathematical knowledge, nor does it require much computer programming skill. The results of the simulation technique were compared with existing solutions for one-dimensional infiltration for Yolo light clay, and good agreement was found. The simulation program does not require a uniform soil or an initially uniformly distributed moisture content in the soil. It can be easily changed to include evaporation from soil. Due to its simplicity the simulation program that was developed may be more appealing than existing techniques to calculate moisture profiles, infiltration rates, and cumulative infiltration. TWO-DIMENSIONAL WATER INFILTRATION FROM A TRENCH IN UNSATURATED SOILS,
Connecticut Agricultural Experiment Station, New Haven.
B. L. Sawhney, and J-Y. Parlange.
Soil Science Society of America Proceedings, Vol 38, No 6, p 867-871, November-December, 1974. 8 fig, 2 tab, 10 ref.

Descriptors: *Soil moisture, *Soil water movement, *Unsaturated flow, *Infiltration rates, Diffusion, Sorption, Conductivity, Model studies, Water transfer, Soils, Soil disposal fields, Flow rates.
Identifiers: Moisture profiles, Wetting fronts.

Two-dimensional infiltration of water from finite trenches was observed in three soil samples with different textures. The vertical infiltration was slowed by the lateral infiltration and the slowing was inversely proportional to the width of the trench. Furthermore, the vertical infiltration was about twice as fast as the lateral infiltration for all soils tested. At the same relative distance from the trench, the soil was drier beside than below the trench. These observations and interpretations agreed with the numerical simulations of Selim and Kirkham. Identifiers: Yolo light clay, Nahal Sinai sand, Gilat loam.

A computer simulation program for predicting n-dimensional moisture flow in soils was tested and presented. The programming was done with the computer program System/360 Continuous System Modeling Program (CSMP). The program is simple and does not require an extensive mathematical background. Sample problems dealing with one-dimensional absorption, spherical absorption, two-dimensional infiltration from a line source, and three-dimensional infiltration from a trickle source compared well with existing solutions. The accuracy of the simulation results is sufficiently high for most purposes, where quantitative answers about soil moisture dynamics are needed. (Gibb-ISWS)

2H. Lakes

AN ECOLOGICAL STUDY OF A BALD-CYPRESS SWAMP IN ST. CHARLES PARISH, LOUISIANA,
Army Engineer District, New Orleans, La.
G. N. Montz, and A. Cherubini.
Castanea, Vol 38, No 4, p 378-386, 1973.
Identifiers: Alternanthera-philoxeroides, *Baldcypress, *Ecological studies, *Louisiana(St. Charles Parish), *Swamps, Taxodium-distichum, *Alligator weeds, Marshes.

A baldcypress (Taxodium distichum (L.) Richard) swamp bordering a marsh in St. Charles Parish was studied by the quadrat method. A dense undergrowth of alligator weed (Alternathera philoxeroides (Mart) Griseb.) covered most of the study area. Plant succession with extension of baldcypress into the marsh was studied by comparing townships maps of 1860 and quadrangle maps of 1955 and 1957 to quadrangle maps of 1969. Only baldcypress was recorded, with tree diameters increasing from the marsh-swamp zone into the swamp. Of the 639 trees recorded in the study area, 357 were dead.--Copyright 1974, Biological Abstracts, Inc.

TEMPERATURE MEASUREMENTS AND INTERNAL WAVES IN SENACA LAKE, NEW YORK,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
M. H. Fliegel.
Available from NTIS, Springfield, Va 22161 as AD-769 227, $5.75 in paper copy, $2.25 in microfiche. Tech. Rept. No. 9, Oct. 1973. 146 p, 66 fig, 6 tab, 26 ref.

Descriptors: *Measurement, *Temperature, *Lakes, *New York, *Waves(Water), Internal waves, Frequency, Wind times, Heat budget,

Heat balance, Heat transfer, Thermal capacity, Seasonal, Dynamics.
Identifiers: *Seneca Lake(NY), Wave direction.

Temperatures were measured near the center of Seneca Lake with thermistors and bathythermographs during four different years. Seneca Lake is a long, narrow, deep lake in the Finger Lakes region of western central New York state, with a temperature structure similar to that of many oceans. The bathythermograph records, which were used to reconstruct the annual temperature cycle of the lake, indicate that it is freely circulating throughout much of the winter although its temperature is below 4C. The annual heat budget was estimated to range between 40,000 and 47,000 cal./cm sq for most years. Amplitude and directional data are given for internal waves. (Houser-ORNL)
W75-04400

DIURNAL TEMPERATURE DISTRIBUTION IN SMALL RESERVOIR,
Missouri Univ., Rolla. Dept. of Mechanical and Aerospace Engineering.
F. Armaly.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 402, $4.25 paper copy, $2.25 microfiche. Completion Report, January 17, 1975. 31 p, 11 fig, 1 tab, 33 ref. OWRT A-080-MO (1), 14-31-0001-4025.

Descriptors: *Reservoirs, *Diurnal distribution, *Thermocline, Model studies, *Stratification, *Water temperature, Impoundments, Absorption, Solar radiation, Evaporation, Convection, Attenuation, Heating, Cooling.
Identifiers: *Solar energy.

The diurnal temperature distribution in a deep water impoundment which is exposed to heating and cooling loads by convection, evaporation and radiation is examined. The diurnal behavior of the solar load, directional and spectral, is used with the selective attenuation and reflection characteristics of the water to account for the internal solar energy absorption rate. Simple atmospheric and water attenuation models were used to examine and simulate the diurnal behavior. The results demonstrate the stratification developments of the reservoir and indicate that in some cases deep layer responds continuously to the diurnal fluctuations of surface energy loads.

INFLUENCE OF FRESHWATER DULUTION ON DYNAMICS OF POPULATIONS OF BUILDER CRUSTACEANS FROM LAGOON OF BIGUGLIA, CORSICA (COROPHIUM INSIDIOSUM C., TANAIS CAVOLINII M.E., ERICHTHONIUS BRASILIENSIS D.), (IN FRENCH),
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
M-L. De Casabianca.
Identifiers: Corophium-insidiosum, *Corsica(Lagoon of Biguglia), *Crustaceans, Density, Dilution, Erichthonius-brasiliensis, Lagoons, Microdeutopus-gryllotalpa, Rain, *Salinity, Tanais-cavolinii, Winter, Lakes, *Brachish water.

The fluctuations of constructing crustacean populations (C. insidiosum, T. cavolinii, E. brusiliensis and Microdentopus gryllotalpa) were studied in the north of the brackish lake Biguglia with monthly calculations of density. This density was estimated during the year 1968/69, which was characterized by exceptional winter rains bringing large quantities of fresh water and lowering the salimity from 34-1.7%. Ninety-five to nearly 100% of the indicated populations disappeared with the current. Experiments on the tolerance of salinity of T. cavolinii and C. insidiosum show that the 2 spp. are fairly euryhaline.--Copyright 1974, Biological Abstracts, Inc.

SALSVATN, A LAKE WITH OLD SEA WATER,
Oslo Univ. (Norway). Dept. of Limnology.
A. Boyum.
Schweiz Z Hydrol, Vol 35, No 2, p 262-277, 1973, Illus.
Identifiers: Lakes, *Norway(Salsvatn Lake), Salinity, *Sea water, Lake sediments.

Salsvatn is a 464 m deep lake laying 16 m above sea level in North Tronfelag, Norway. The lake was isolated from the sea some 3000 yr ago. It is assumed that salt-water in the deepest 50 m of the lake is the remainder of sea water trapped in the lake at this time. The concentration of chloride in the salt-water layer corresponds to a salinity of 29% as in ordinary sea water. The hydrography of the lake and changes in some components of the salt water compared with ordinary seawater are discussed. A comparison is made with changes in the stagnant layers of the Black Sea and Lake Rorholtfjorden. The latter is another lake with old sea water at its bottom. Surface sediment samples were collected from the freshwater and salt-water layers in Lake Rorholtfjorden and from the salt-water layer of Lake Salsvatn. Some chemical components of the sediments and interstitial water were analyzed.--Copyright 1974, Biological Abstracts, Inc.

REGULATION OF GREAT LAKES WATER LEVELS--APPENDIX E--COMMERCIAL NAVIGATION,
International Joint Commission-United States and Canada. Great Lakes Levels Board.
December, 1973. 162 p, 20 fig, 69 tab.

Descriptors: *Great Lakes, *Water level fluctuations, *Economic impact, Evaluation, *International Joint Commission, Great Lakes Region, Lakes, Water levels, *Regulation, Water management(Applied), Comprehensive planning, Planning, Water policy, Transportation, Water resources development, Cost-benefit analysis, Governmental interrelations, United States, Canada, Economics, Foreign trade, Economic prediction, Navigation.
Identifiers: Environmental policy, International agreements, Coastal zone management.

Analyzed are the effects of lake level fluctuations upon commercial navigation interests within the Great Lakes-St. Lawrence River System. The appendix details the methodology applied in the assessment of the potential benefit or loss to shipping and the evaluation of economic effects upon navigation of regime changes that would occur under selected regulation plans. A computer program was prepared to integrate such factors as vessel characteristics, fleet size and composition, prospective commerce, and operating costs. All costs and benefits are based on 1971 price levels and an interest rate of seven percent. Transportation costs were determined for the four bulk commodities of iron ore, coal, limestone and grain which comprise nearly eighty-five percent of all Great Lakes traffic. Evaluations were made for the year 1970, using actual data, and for the years 1995 and 2020, using estimates of future traffic and vessel fleet composition and characteristics. Evaluation of commodities comprising the remaining fifteen percent was deemed to have no significant effect upon the results obtained using the four major bulk commodities. TEMPERATURE DYNAMICS IN DIMICTIC LAKES,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
H. Stefan, and D. E. Ford.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY1, Proceedings paper 11058, p 97-114, January 1975. 11 fig, 25 ref, 2 append.

Descriptors: *Limnology, *Lakes, *Reservoirs, Hydrodynamics, Temperate, *Energy budget, Heat budget, Thermal properties, Turnovers, Heating, Heat transfer, Conduction, Convection, Radiation, Thermocline, Stratification, Environmental engineering, Hydraulics, Winds, Weather, *Water temperature, *Forecasting.
Identifiers: *Dimictic lakes.

Daily water temperature profiles in temperate or dimictic lakes (defined as those lakes whose surface temperature is above 4C in summer and below 4C in winter) were predicted from time-variable meteorological conditions and lake morphology. A total energy concept was used. The method of analysis was derived and illustrated through case studies. Agreement of predicted and measured water temperatures in two lakes throughout the summer season was good. Although energy inputs and losses were computed separately, the method of analysis recognized and incorporated the mutual interdependence between different forms of energy input. (Jess-ISWS)

2I. Water In Plants

THE INFLUENCE OF SOIL WATER POTENTIAL ON THE PERENNIAL VEGETATION OF A DESERT ARROYO,
New Mexico State Univ., University Park. Dept. of Biology.
F. R. Balding, and G. L. Cunningham.
The Southwestern Naturalist, Vol 19, No 3, p 241-248, September 23, 1974. 1 fig, 2 tab, 4 refs.

Descriptors: *Arroyos, *Soil water, Soil moisture, Regression analysis, Arid climates, Semiarid climates, Soil chemical properties, Soil physical properties, Shrubs, Plant groupings, Vegetation, Ephemeral streams, Drainage, Precipitation(Atmospheric), Soil-water-plant relationships, *Desert plants.
Identifiers: Soil water potential gradient.

Soil water potential is an important environmental factor limiting the numbers and sizes of perennial plant species in arid and semi-arid regions. The density, mean plant height, and mean plant width of the perennial shrubs in a small desert arroyo were compared with the soil water potential gradient along the arroyo during one growing season. The density of shrubs was negatively correlated with the soil water poteneital gradient, while shrub mean size was positively correlated with the gradient. The soil water potential alone can not account for the variation in vegetation parameters; additional factors such as soil chemical and physical properties, and interactions between the species present also contribute to the variations. SPY MESA YIELDS BETTER UNDERSTANDING OF PINYON-JUNIPER IN RANGE ECOSYSTEM,
Soil Conservation Service, Phoenix, Ariz.; and Bureau of Land Management, Phoenix, Ariz.
A. P. Thatcher, and V. L. Hart.
Journal of Range Management, Vol 27, No 5, p 354-357, September 1974. 1 tab, 7 fig, 11 ref.

Descriptors: Ecosystems, Soils, Soil types, Pinyon pine trees, Juniper trees, Shrubs, Grasses, Infiltration, Runoff, Soil-water-plant relationships, Soil surfaces.
Identifiers: Spy Mesa, Arizona, Plant succession.

The natural occurrence of pinyon-juniper in range ecosystems was studied in Spy Mesa relict area of the Arizona Strip in northern Arizona. The area has a wide variety of soils, and natural fires have occurred over the past 50 years. Following natural fires, grasses became significant only on soils with sandy surface textures. Pinyon-juniper was the dominant species in the absence of fire regardless of the soil type. No significant amounts of grass were produced at any platy surface layer. Soils with this characteristic have poor water infiltration rates and high runoff rates eliminating those plants that are unable to compete for limited moisture. Pinyon, juniper, and shrubs are the principal plants produced on these soils. Soils having granular sandy loam surface layers, even when very shallow, produced large quantities of grass under natural conditions. (Mastic-Arizona)

RESPONSE OF HERBACEOUS VEGETATION TO FELLING OF ALLIGATOR JUNIPER,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
W. P. Clary.
Journal of Range Management, Vol 27, No 5, p 387-389, September 1974. 1 tab, 2 fig, 12 ref.

Descriptors: *Juniper trees, *Forage grasses, *Range management, *Plant growth regulators, *Arizona, Runoff, Soil-water-plant relationships, Sediments, Ranges, Small watersheds, Vegetation, Forage production.
Identifiers: Tree felling.

A 13 percent crown cover of alligator juniper was removed from a 100 acre experimental watershed in north-central Arizona resulting in a 38 percent increase in total herbage production and a 45 percent increase in forage plant production. Felling with power saws was used to eliminate soil pits areated by uprooting through cabling or pushing. These pits are considered undesirable because they reduce runoff by retaining surface water, are a potential source of sediment, and much of the cool season grasses are destroyed which normally grow beneath the tree crowns. Herbage increases were highly variable with little or no response in 3 of the 7 post-treatment years. Indications are that average herbage production may reach a near steady state within several years after tree removal. Little effect of the treatment on ground cover and range condition was detected suggesting that major changes will either take long periods of time or require major changes on grazing management. (Mastic-Arizona)

RANGE PLANT YIELD AND SPECIES RELATIONSHIPS IN NATURAL AND PARTIALLY CONTROLLED ENVIRONMENTS,
Agricultural Research Service, Logan, Utah.
A. T. Bleak, W. Keller, and A. C. Hull, Jr.
Journal of Range Management, Vol 27, No 5, p 396-399, September, 1974. 4 tab, 3 fig, 4 ref.

Descriptors: *Soil moisture, *Crop production, *Arid lands, *Soil-water-plant relationships, *Forage grasses, Precipitation(Atmospheric), Root systems, Harvesting, Alfalfa, Utah, Soil moisture meters.
Identifiers: Crested wheatgrass, Russian wildrye, Cheatgrass, Kochia.

The effect of stand improvement or depletion with age, the production by single species and species mixtures, and soil moisture depletion within isolated plants were studied using alfalfa, cheatgrass, Kochia, crested wheatgrass, and Russian wildrye. Plots were isolated from the surrounding soil by heavy plastic sheeting to a depth of 1.4 m. Some plots received only natural precipitation some 1 - 1/2 times the growing season precipitation, some 2/3 of the normal precipitation. These different moisture levels had no significant effect on herbage yields over a 3 year period. Alfalfa plots were the most productive. Alfalfa and Kochia were found to have put roots beneath the plastic barrier into the adjacent soil. Alfalfa was least affected and Kochia most affected by a close (5 cm.) harvest height. (Mastic-Arizona)

WATER UPTAKE BY SEEDS AS AFFECTED BY WATER STRESS, CAPILLARY CONDUCTIVITY, AND SEED-SOIL WATER CONTACT. I. EXPERIMENTAL STUDY AND, II. ANALYSIS OF EXPERIMENTAL DATA,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Dept. of Soil Physics.
A. Hadas, and D. Russo.
Agronomy Journal, Vol 66, No 5, p 643-652, September-October 1974. 11 fig, 2 tab, 21 ref, 2 parts.

Descriptors: *Hydraulic conductivity, *Soils, *Germination, *Arid lands, Seeds, Seed treatment, Soil water, Soil texture, Stress, Soil aggregates.
Identifiers: Seed-soil water contact area, Chickenpea, Pea, Vetch.

Inhibition and seed germination as affected by water potentials, hydraulic conductivity, and seed-water area contact were studied. Chickenpea, pea, and vetch seeds were germinated in pure, aerated water and in sand or aggregate fractions of various grain-sized classes. Results show that low values of external water potential affect the rate of water uptake, but not percent of germination as long as waterpotential is higher than a critical value that is a species-specific. For a given seed-water contact area, any decrease in hydraulic conductivity reduced rates of water uptake and germination; total germination was not affected as long as the critical water potential was not reached. The data also shows that for optimal seed-soil water contact in aggregated soils, the mean aggregate size should be one-fifth to one-tenth of the seed's diameter. Possible applications to field practices, such as seed-bed preparation, are discussed. (Mastic-Arizona)

ENERGY BUDGET MEASUREMENTS OVER THREE COVER TYPES IN EASTERN ARIZONA,
Forest Service (USDA), Tempe, Ariz. Forest Hydrology Lab.
J. R. Thompson.
Water Resources Research, Vol 10, No 5, p 1045-1048, October 1974. 4 fig, 2 tab, 12 ref.

Descriptors: *Energy budget, *Evapotranspiration, *Small watersheds, *Vegetation effects, *On-site data collections, Radiation, Seasonal, Plant growth, Pine trees, Clear-cutting, Precipitation(Atmospheric), Slopes, Soil temperature, Runoff, Rain gages, Streamflow, Arizona, Climatic data, Solar radiation, Dew point, Vapor pressure.

Measurements of net radiation and evapotranspiration were made over a 3-year period for a pine forest, a cienega, and a clear-cut opening in the Apache National Forest of eastern Arizona. Seasonal patterns for net radiation and evapotranspiration were determined using the energy budget measurements in the Bowen ratio equation. Evapotranspiration for the growing season was 19.4 inches for the forest, 15.3 inches for the clear-cut, and 13.2 inches for the cienega. Weighting these amounts by the extent of the cover type resulted in an average evapotranspiration amount of 18.4 inches for the growing season. Some inconsistent results were obtained when data were used from days when reverse vapor pressure gradients existed. The ratios appeared reasonable when only data from days with continuous vapor movement away from the surface were used. With all data combined, the ratios lost some of the seasonal pattern. (Mastic-Arizona)
W75-04383

PHENOLOGICAL EVENTS AND THEIR ENVIRONMENTAL TRIGGERS IN MOJAVE DESERT ECOSYSTEMS,
California Univ., Los Angeles. Lab of Nuclear Medicine and Radiation Biology.
J. C. Beatley.
Ecology, Vol 55, No 4, p 856-863, Autumn 1974. 1 fig, 20 ref.

Descriptors: *Phenology, *Ecosystems, *Rainfall, *Desert plants, *Arid climates, Plant populations, Rodents, Soil Moisture, Temperature, Animal populations.
Identifiers: *Mojave Desert.

The occurrence of phenological events in the Mojave Desert ecosystem are dependent on heavy rains (> 25 mm (1 in)). The most predictable of these are the regional rains between late September and early December. Rains during this period are necessary for successful vegetative and reproductive growth of most shrubs, perennials, and annuals in the following winter and spring. Summer rains appeared to have little immediate

significance for most native plant and animal populations except under certain conditions when rainfall may trigger growth and reproduction of primary producers permitting at least moderate or local success every season. Whether seasonal success is to be regional or local is not predictable except as the season progresses and the pattern of expression of the controls unfolds during the autumn and winter months. (Mastic-Arizona)
W75-04385

ECONOMICS OF FERTILIZER APPLICATION ON RANGE AND MEADOW SITES IN UTAH,
Utah State Univ., Logan. Dept. of Range Science.
J. P. Workman, and T. M. Quigley.
Journal of Range Management, Vol 27, No 5, p 390-393, September 1974. 1 fig, 4 tab, 12 ref.

Descriptors: *Forage grasses, *Range management, *Fertilizers, *Economics, *Utah, Ranges, Marginal return, Nitrogen, Phosphorus, Nitrates, Harvesting, Hay, Profit, Grazing, Precipitation(Atmospheric), Grasslands.

Forage production responses to applications of nitrogen and phosphorous on five Utah range and meadow sites and one Idaho range were subjected to economic analysis. None of the sites studied responded to phosphorus application, but forage production on three sites increased significantly with nitrogen applications in the form of ammonium nitrate. Standard marginal economic analysis indicated that when the forage was harvested for hay, nitrogen application was profitable on the semi-wet meadow and mountain loam sites. Fall application offered a definite advantage over spring application on both sites. Nitrogen application proved unprofitable when increased production was valued in terms of range forage. (Mastic-Arizona)
W75-04388

FASCICLE DENSITY AND NEEDLE GROWTH RESPONSES OF RED PINE TO WATER SUPPLY OVER TWO SEASONS,
Forest Service (USDA), Durham, N.H. Northeastern Forest Experiment Station.
P. Garrett, and R. Zahner.
Ecology. Vol 54, No 6, p 1328-1334. 1973, Illus.
Identifiers: *Fascicle density(Pines), Growth rates, Mitosis, *Needle growth(Pines), *Pine trees(Red), Pinus-Resinosa, Seasonal, Water supply.

The ontogeny of terminal growth in red pine (Pinus resinosa Ait.) suggests that the growing season in Michigan be divided into three 2-mo. periods: April-May, June-July, and Aug.-Sept. It is during the middle period that mitotic activity at the shoot apex initiates dwarf shoot primordia in the bud for the subsequent season's foliage; thus, preconditioning 1 yr has a strong effect on next year's growth. Water was applied to or withheld from the soil under 23-yr-old trees in various combinations of the 2-mo. periods over 2 growing seasons. All effects of drought were greatest on the terminal shoot of the main stem, diminishing on terminals of branches with distance from the apex, and disappearing at the base of the crown. Shoot extension was governed equally by conditions of the middle period of the previous year and of the early period of the current year. Each year fascicle density was regulated only by water conditions of the early period of the current year, regardless of preconditioning. Spacing of needles on shoots depended on elongation of the stem internodes between dwarf shoots, and was independent of the number of fascicles. Number of fascicles per shoot was governed only by conditions of June-July of the previous year, with drought during this period reducing the number of 30%. Length of needles was related to two factors: the number of fascicles produced per shoot and the water treatment of the period during which needles elongated. Thus when the water supply of the middle of the previous year was deficient, fewer but longer needles were produced currently; when water during the middle of the current year was deficient, needles were reduced in length by about 30%. It is concluded that the interaction of 2 seasons' water supply are usually compansative, rarely additive. The average net effect on foliage production is a long-term, year-to-year stabiility in photosynthetic potential for red pine.--Copyright 1974, Biological Abstracts, Inc.
W75-04424

DOMINANCE OF CALIFORNIA ANNUAL GRASSLANDS BY BRASSICA NIGRA,
Illinois Univ., Urbana. Dept. of Forestry.
D. T. Bell, and C. H. Muller.
Am Midl Nat. Vol 90, No 2, p 277-299. 1973 Illus.
Identifiers: Allelopathic mechanism, Animal boraging, Annual, Avena-Fatua, *Brassica-Nigra, Bromus-Mollis, Bromus-Rigidus, Browsing, *California, *Grasslands, Leachate, Pasture.

B. nigra (L.) Koch is a dicotyledonous member of the annual grassland vegetation of southern California. Pasture grassland areas often show pure stands of this species surrounded by areas inhabited by various mixtures of the grassland associates. Yearly regeneration of these pure stands occurs at the 1st rainfall of late autumn and initiates the growing season of all annual species of this vegetative type. At this time the weedy grass species which characterize these annual grasslands are notably absent in the areas of Brassica dominance. The exclusion of the grasses, such as Avena fatua, Bromus rigidus and Bromus mollis occurs primarily as a result of an allelopathic mechanism, involving the leaching of water soluble toxins from standing dead stalks and dead leaf material remaining in the soil. The pattern of geographic isolation of the species was shown not to be a result of spatial differences in soil texture, pH or temperature. Competitive mechanisms involving light or soil factors failed to be effective in this case of interference. Animal foraging was shown to be of minimal consequence. A potentially highly allelopathic, volatile toxin from living vegetative parts of Brassica was shown to lack an ecologically effective mechanism. Exudates from germinating seeds exhibited no effect upon grass seed in the laboratory and the possibility that this mechanism could be operative under field conditions is negligible. Water soluble phytotoxins, however, provide an ecologically effective mechanism which is operative in this field-inhibition phenomenon. Water soluble toxins inhibit the annual grassland species and permit the invasion and control of extensive grassland areas by B. nigra.--Copyright 1974, Biological Abstracts, Inc.
W75-04435

SOME EFFECTS OF SPRING SNOWMELT RUNOFF ON AQUATIC INVERTEBRATE POPULATIONS IN A HIGH MOUTAIN STREAM,
Wyoming Univ., Laramie. Water Resources Research Inst.
W. R. Good.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 405, $5.25 paper copy, $2.25 microfiche. Completion Report, Water Resources Series No 50, April 1974. 103 p, 20 fig, 8 tab, 25 ref, 7 append. OWRT A-006-WYO (1).

Descriptors: *Snowmelt, *Wyoming, *Invertebrates, *Benthos, Runoff, Water temperature, Streams , *Diptera, Reproduction, *Breeding, *Hatching.
Identifiers: Nash Fork Creek(Wyo).

This study investigates the abiotic and biotic factors acting on a community of benthic invertebrates in a high mountain stream during the spring snowmelt runoff period. Data used were collected in 1970. The study area was a 1 km section of Nash Fork Creek near 3,000 m in the Snowy Range, Wyoming. Runoff began in mid-May when the discharge was 6 c.f.s., rose erratically to a peak on June 25, at 125 c.f.s., then dropped through the rest of the summer. Water temperatures increased through the runoff from 0C. in mid-May to 4.5-11.5C. on June 25 and 7-16C. by July 21. The general snow cover over the stream present in mid-May was gone by June 4. For each invertebrate species in the study area which could be separated, population estimates were made, size ranges were recorded, and when possible, hatching and breeding periods were noted. Adjustment of the life cycle was a common means of adaptation to the runoff and was manifested in several ways: (1) The Diptera avoided exposing pupae to the peak of the runoff; (2) Many insect species were found to breed during the runoff; (3) Prolonged hatching of eggs or avoidance of hatching, were recongized as runoff-survival strategies.
W75-04450

VERTICAL DISTRIBUTION OF FRESHWATER MUSSELS (PELECYPODA, UNIONIDAE) IN SOUTHWESTERN FINLAND,
Turku Univ. (Finland). Dept. of Zoology.
E. Haukioja, and T. Hakala.
Ann Zool Fenn Vol 11, No 2, p 127-130, 1974. Illus.
Identifiers: Anodonta-piscinalis, Clays, *Distribution patterns, *Finland, Lakes, *Mussels(Freshwater), Pelecypoda, Pseudanodonta-complanata, Rivers, Silt, Unio-pictorum, Unio-tumidus, Unionidae, Vertical distribution.

Species composition, numbers and biomass in relation to depth are presented for a lake and a river in southwestern Finland. Species found were Unio tumidus, U. pictorum, Anodonta piscinalis and Pseudanodonta complanata. U. pictorum was most strictly limited to shallow waters and P. complanata to deeper waters. A piscinalis evidently had the widest tolerance of depth. Highest densities and biomass (up to 11.8 kg/m2) were found in 0-1 m depth. From this depth downwards densities decreased sharply and few individuals were found at 5 m. In all species the smaller individuals tended to live in shallower waters. The nature of the bottom was also important; all mussels avoided hard clay and very soft silt.--Copyright 1974, Biological Abstracts, Inc.
W75-04486

DISTRIBUTION AND ECOLOGY OF AMPHIPODES (ESPECIALLY GAMMARIDES) IN THE BASIN AND ESTUARY OF THE DOURDUFF RIVER (BRITTANY, FRANCE), (IN FRENCH),
Amsterdam Univ. (Netherlands). Inst. of Taxonomic Zoology.
Marion J. Van Maren.
Bull Zool Mus Univ Amst Vol 3, No 22, p 189-209, 1974. Illus.
Identifiers: *Amphipods, Competition, *Distribution patterns, Echinogammarus-berilloni, *Ecology, Estuary, *France(Dourduff River), Gammarids, Gammarus-chevreuxi, Gammarus-zaddachi, Reproduction, River basins, Salinity, Seasonal.

Stations (1-5) situated at the head of the Dourduff-estuary (Brittany, France), were sampled monthly at springtide during the period of May-Oct. 1971. The data obtained this way show a shifting in the populations of Echinogammarus berilloni, Gammarus chevreuxi and G. zaddachi from the upstream part of the estuary downstream and vice versa. E. berilloni can exist in the head of the estuary as long as G. chevreuxi and G. zaddachi are few in number or absent (i.e., May-Sept.). When in Sept. the latter 2 spp. repopulate the upstream part of the estuary, E. berilloni disappears from this river section and is found only farther upstream. Because it has been domonstrated that E. berilloni can sustain salinities up to 80% seawater (Vincent, 1966), the increased salinity in the head of the estuary, during the springtides in au-

tumn, can not explain the disappearance of this species in that part of the river. The reproduction period of E. berilloni falls during May and June. Several places in the estuary, samples were taken in the main stream and in the brooklets discharging into it. This sampling resulted in a survey of the distribution of gammarids in the estuary in correlation with some environmental factors. A microgeographical analysis was executed in the non-estuarine part of the Dourduff and its ramifications. The distribution of species in this part of the river system is shown.--Copyright 1974, Biological Abstracts, Inc.

NOTE ON GROWTH OF THE BREAM, ABRAMIS BRAMA (LINNAEUS, 1758) IN THE ORLIK VALLEY WATER RESERVOIR,
Karlova Universita, Prague (Czechoslovakia). Lab. of Ichthylogy.
A. S. Naiksatam.
Vestn Cesk Spol Zool, Vol 38, No 2, p 113-116, 1974, Illus.
Identifiers: Abramis-brama, *Bream, *Czechoslovakia(Orlik Valley reservoir), *Growth rates, Reservoirs, Scales, Age.

Age and growth was studied by using scales of 121 specimens of A. brama from the Orlik valley water reservoir of Czechoslovakia. Computation of growth history was made by using Lee's method. The growth of bream from the Orlik valley water reservoir compared with some selected data published from various localities of Czechoslovakia, show a relatively slow rate of growth compared with the growth in other valley water reservoirs. In comparison with the data summarized by Oliva and by Poupe the rate of growth is average.--Copyright 1974, Biological Abstracts, Inc.

REMARKS ON BIONOMY OF FAMILY CYPRINODONTIDAE (PISCES) WITH RESPECT TO DEPENDENCY OF DEVELOPMENT OF EMBRYOS OF ROLOFFIA FOLOFFI (AHL., 1938) ON THE HARDNESS OF THE WATER, (IN GERMAN),
S. Frank.
Vestn Cesk Spol Zool, Vol 38, No 1, p 13-18, 1974, Illus.
Identifiers: *Bionomy, *Cyprinodontidae, *Embryo development, Extracts, Peat, Pisces, *Roloffia-roloffi, *Water hardness.

The jungle waters of southern Sierra Leone in western Africa are the habitat of R. roloffi, which is easily kept in aquariums. The optimal water hardness range for the development of eggs and larvae is approximately 14-16 degrees dNKH (a measurement of noncarbonate or sulfate content), in which case mortality reaches a maximum of 5%. When water hardness is reduced to 10 degrees or increased to 20 degrees, mortality increases significantly. When carbonate content exceeds 1 degree, the net negative effect is even more drastic. Peat extracts almost double the embryonic development time at a constant water temperature of 26C, increasing it from 10-12 days to 18-22 days; mortality also increases.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF LEAF AREA REDUCTION ON THE WATER REQUIREMENT OF BARLEY (HORDEUM VULGARE L.),
Arizona Univ., Tucson.
A. L. Foutz, A. K. Dobrenz, and M. A. Massengale.
Journal of the Arizona Academy of Science, Vol 9, No 2, June 1974. p 51-54, 3 fig, 1 tab, 17 ref.

Descriptors: *Transpiration, *Transpiration control, *Water requirements, *Barley, *Crop yield, *Defoliation, Plant growth, Leaves, Crop production, Photosynthesis.
Identifiers: *Defoliation, Leaf area reduction.

Since transpiration accounts for a large percentage of water used by a crop, efficiency could be increased by decreasing transpiration. In this experiment, leaf blades were clipped when the flag leaf emerged from the sheath. Leaf area reduction treatments consisted of (a) removal of all the leaves except the flag leaf (b) removal of all leaves except the flag and two adjacent leaves, and (c) the removal of all leaves except the flag and one adjacent leaf, and (d) no leaf removal. Transpiration rates were decreased with increased leaf area reduction. Yields of the defoliated plants were also significantly reduced with increased leaf area reduction. Leaf removal may be an effective water use reduction technique in producing a barley crop. Timing of defoliation treatments is critical to prevent severe reductions in yields, and should be made when the flag leaf is fully emerged. (Mastic-Arizona)

MODEL FOR PREDICTING PLANT YIELD AS INFLUENCED BY WATER USE,
Utah State Univ., Logan.
R. J. Hanks.
Agronomy Journal, Vol 66, No 5, p 660-665, September-October, 1974. 4 tab, 6 fig, 22 ref.

Descriptors: *Plant growth, *Water utilization, *Model studies, *Crop production, *Soil-water-plant relationships, Soil water, Transpiration, Evaporation, Irrigation, Drainage, Field capacity, Wilting, Moisture uptake, Evapotranspiration, Rainfall, Agriculture.

A model is presented for predicting plant yield in both total dry matter and grain, as a function of water use. It was assumed that transpiration is the only water-use factor directly influencing plant growth. Evaporation and drainage have an indirect influence on the amount of water available for transpiration. The yield-water use curve was found to be sensitive to transpiration and evaporation assumptions. The model is simple and inexpensive to run on a computer, and can be used to predict seasonal yields based on factors such as irrigation frequency and amount of rainfall and soil water storage. (Mastic-Arizona)
W75-04609

SOME EFFECTS OF SUBIRRIGATION ON BENTGRASS DURING HEAT STRESS IN THE FIELD,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
J. V. Krans, and G. V. Johnson.
Agronomy Journal, Vol 66, No 4, p 526-530. July-August, 1974. 3 tab, 5 fig, 10 ref.

Descriptors: *Irrigation effects, *Turf grasses, *Root development, *Root distribution, *Crop production, Sprinkler irrigation, Heat, Temperature, Stress, Aeration, Wilting, Chlorphyll, Fertilization, Water table, Soil gases.
Identifiers: *Subirrigation, Bentgrass, N chlorosis.

The alleviation of the adverse effects of heat stress by subirrigation of bentgrass was studied. Results of prolonged temperature stress include dissication, disease, or insect damage. Effects were evaluated in a field study from clipping yields, chlorphyll content, and root distribution. Root development was significantly improved by subirrigation. Wilting was not experienced by plants under this treatment, while surface irrigated treatments required periodic syringing to alleviate this problem. A major problem of the subirrigated treatment was N chlorosis related to a high temperature and poorly aerated environment. Proper adjustment of water table levels and surface fertilization should improve aeration and eliminate N chlorosis increasing turf quality. (Mastic-Arizona)
W75-04612

EFFECT OF ROOT PRUNING ON WATER RELATIONS AND GROWTH OF COTTON,
Southern Regional Research Lab., New Orleans, La.; and Alabama Agricultural Experiment Station, Auburn.
J. R. Stansell, B. Klepper, and V. D. Browning.
Agronomy Journal, Vol 66, No 4, p 591-592. July-August, 1974. 3 fig, 1 tab, 10 ref.

Descriptors: *Root development, *Root distribution, *Plant growth, *Root systems, *Soil-water-plant-relationships, Moisture uptake, Soilwater, Growth rates, Moisture content, Cotton, Moisture stress.
Identifiers: Root pruning.

An experiment was conducted to determine the effects of root-system loss on plant water use and growth rates. Approximately one-fourth of the root length was severed by forcing a sharp-edged plate horizontally through the soil in a study compartment. Growth parameters such as stem diameters and plant height were measured daily along with water uptake by the cotton plants. Growth reductions were greater after root pruning when the root systems were small and concentrated in the upper 25 cm. of soil. Growth was less affected in plants with deeper and more extensive root systems. Although the proportion of roots removed was approximately the same, greater growth reduction occured in the more concentrated root systems indicated that the effect of root pruning, especially after soil water content had decreased, depends on distribution of the remaining root system rather than the percentage of roots removed. (Mastic-Arizona)

RELATIVE INFLUENCE OF MOISTURE-AERATION AND NUTRIENTS ON VEGETATION AND BLACK SPRUCE GROWTH IN NORTHERN ONTARIO,
Great Lakes Forestry Research Center, Sault Sainte Marie (Ontario).
J. K. Jeglum.
Can J For Res, Vol 14, No 1, p 114-126, 1974.
Identifiers: *Aeration, *Black spruce, *Canada(Ontario), *Growth rates, *Moisture, *Nutrients, Peatlands, Picea-Mariana, Sites, Spruce, Vegetation.

Results from a principal component analysis suggest that nutrient regime is more important to vegetational variation than the moisture-aeration regime. Correlations between site index and habitat measures suggest that the moisture-aeration regime influences tree growth more than the nutrient regime. For particular components of vegetational variation and for segments of the total data the proportional influence of the 2 gradients varies. Moisture-aeration and nutrient regimes explain a large proportion of the variation in minor vegetation and tree growth on black spruce (Picea

mariana) peatlands (Canada).--Copyright 1974, Biological Abstracts, Inc.

SUSPENDED SOLIDS CARRIED BY THE GALLATIN RIVER OF SOUTHWESTERN MONTANA: AMOUNTS CARRIED DURING SPRING RUNOFF,
Montana State Univ., Bozeman. Dept. of Plant and Soil Science.
M. G. Klages, L. D. Logan, and Y. P. Hsieh.
Northwest Sci, Vol 47, No 4, p 203-212, 1973, Illus.
Identifiers: Clays, Erosion, Measurement, *Montana(Gallatin River), Rivers, *Runoff, Sediments, Silt, Snow, Spring, *Suspended solids, *Turbidity, Snowmelt.

Erosion resulting from spring snowmelt and resultant runoff is the major contributor to suspended solids in the Gallatin River. The suspended load varies with time, but one season can be compared to another if several samplings are averaged. Yearly variations in suspended load were not closely related to either total runoff or peak flow. Runoff from urban and agricultural lands contributes to sediment early in the season before snowmelt begins in the mountains. Streambank erosion is an important source of sediment in the broad lower valley during the high spring flow accompanying melting of the mountain snowpack. Geology is one of the important factors controlling suspended load in the steep, mountainous terrain of the upper part of the drainage. Soft, easily eroded, and unstable sedimentary rocks produce most of the suspended solids. Taylor Fork is one of the major contributors to sediment in the Gallatin River. Hard volcanic and metamorphic igneous rocks give rise to clearer streams in this watershed even though the harder rocks are accompanied by stronger relief. Turbidity measurements can be used to estimate suspended solids. They are more accurate on suspended silt and clay than on total suspended solids.--Copyright 1974, Biological Abstracts, Inc.

A GEOPHYSICAL AND GEOLOGICAL INVESTIGATION OF POTENTIALLY FAVORABLE AREAS FOR PETROLEUM EXPLORATION IN SOUTHEASTERN ARIZONA,
Arizona Univ., Tucson. Geophysics Lab.
C. L. V. Aiken, and J. S. Sumner.
Arizona Oil and Gas Conservation Commission, Phoenix, Report of Investigations 3. 1974, 40 p, 17 fig, 4 tab, 58 ref.

Descriptors: *Sedimentation, Geology, Exploration, Arizona, Fuels, Oil, Deposition(Sediments), Geophysics, Gravity studies, Cenozoic Era, Sedimentary petrology, Magnetic studies, Drill holes.

Surface geological investigations in the mountain ranges indicate that a thick sequence of marine sedimentary Paleozoic and Mesozoic (Cretaceous) rocks was deposited in the Pedregosa basin in southeastern Cochise County and adjacent shelf areas. The marine strata deposited in this basin are similar in many aspects to those in petroleum-productive areas in southeast New Mexico and west Texas. They contain organic-rich basin facies of rocks that were probable sources for oil and gas. Adverse factors such as the wide thickness variance of Cenozoic valley fill (100 feet or less to almost 12,000 feet) impede geologic investigations for petroleum. Data have been collected from gravity and magnetic and drill hole investigations. (Bahre-Arizona)

SEDIMENT TRAP EFFICIENCY OF SMALL RESERVOIRS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
F. E. Dendy.
Transactions of the American Society of Agricultural Engineers, Vol 17, No 5, p 898-901, September-October 1974. 4 fig, 1 tab, 16 ref.

Descriptors: *Reservoirs, *Sediments, *Trap efficiency, Volume, Inflow, Watersheds(Basins), Suspended load, Efficiencies, Indexing, United States, *Lake sediments.

Despite widely varying reservoir sizes, shapes, sediment inflow rates, and volumes, trap efficiencies varied little among 17 small flood-water retarding reservoirs throughout the United States. Trap efficiencies ranged from 81 to 98% for periods of from 4 to 16 years. Trap efficiencies for dry reservoirs were essentially the same and varied over about the same range as ponded reservoirs. Relationships between trap efficiency and various parameters including capacity/watershed, capacity/inflow, calcium-sodium ratios, reservoir shapes, and sediment particle sizes were poorly defined and only explained a small portion of the total variation. Structures with a capacity/inflow ratio greater than 0.1 will trap 80 to 95% of inflowing sediments. Trap efficiencies of sediment particles larger than 0.062 mm range from 96 to 100%. The correlation coefficient between computed and observed trap efficiency values was 0.96. Thus, the prediction equation should provide reasonably good estimates, within 10 to 15%, of trap efficiency for most small reservoirs. (Dawes-ISWS)

SOIL EROSION AND SEDIMENT TRANSPORT FROM GULLIES,
Agricultural Research Service, Columbia, Watershed Research Unit.
R. F. Piest, J. M. Bradford, and G. M. Wyatt.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY1, Proceedings paper 11069, p 65-80, January 1975. 7 fig, 4 tab, 19 ref, 1 append.

Descriptors: *Erosion, *Gullies, *Mass wasting, *Sedimentation, *Tractive forces, Soil mechanics, Sediment transport, Watersheds(Basins), Soil conservation, Watershed management, Storm runoff, Hydraulics, *Iowa.
Identifiers: *Treynor(Iowa), Loess soil mantle.

Field observations of four gullied watersheds, 74 acres to 150 acres in size, showed that gully erosion was one-fifth of the total sediment yield during a 9-yr period. Erosion rates were dependent upon mass wasting of loessial gully banks and headcuts. For the nonconservation watersheds, tractive forces exerted by runoff on the channel boundary did not detach appreciable amounts of undisturbed soil but were more than adequate to entrain the soil debris yielded by mass-wasting processes. Gully erosion was minimal on conservation watersheds; the runoff was generally below the levels required for gully debris removal, and the degree of slope was reduced to a stable value. Soil mechanics principles, applied to strength/stability aspects of gully banks in western Iowa, indicated that the height of the water table, soil cohesive strength, and rate of water infiltration are controlling factors. Initial field and laboratory model experiments provided insight into variables that affect the mass-wasting process. A large part of the gully soil debris accumulates during winter and early spring and is flushed from the channel with the first spring rainstorms. The relative quantities are greatly reduced for each subsequent runoff event during the year. (Singh-ISWS)

DEPOSITION OF WATER AND CATIONS ON ARTIFICIAL FOLIAR COLLECTORS IN FIR KRUMMHOLZ OF NEW ENGLAND MOUNTAINS,
Cornell Univ., Ithaca, N.Y. Dept. of Ecology and Systematics.
W. H. Schlesinger, and W. A. Reiners.
Ecology, 55(2): 378-386, Illus, 1974.
Identifiers: Abies-balsamea, *Calcium, *Cations, *Fir krummholz, Foliar collectors, *Lead, *Magnesium, Mountains, New England, *Potassium, *Sodium, *New Hampshire.

Atmospheric depositions of water Ca, Mg, Na, K and Pb were measured in an Abies balsamea krummholz ecosystem in New Hampshire. Two types of collectors were used. Open buckets captured rainout, washout and sedimentation (bulk precipitation), while buckets with attached artificial conifer foliage collected intercepted aerosols and cloud droplets as well as bulk precipitation. Water catchment averaged 4.5 times greater in the foliar collectors than in open buckets, and Ca, Mg, Na, K and Pb deposition averaged 8.3, 6.0, 4.9, 5.7 and 5.5 times greater, respectively, in the foliar collectors. Most of the increase in foliar collectors was due to higher volume catchment, but some concentration enrichment through interception was also contributory. These data cannot be extrapolated to elemental deposition per unit area without correcting capture efficiency of collectors to that of natural vegetation. These data do strongly suggest, however, that in areas of high wind and frequent exposure to clouds or fog, such as in mountain areas of New England, measurements of total elemental deposition require an evaluation of interception as well as bulk precipitation.--Copyright 1974, Biological Abstracts, Inc.

THE OCCURRENCE OF YOUNG SARDINELLA AURITA IN THE BRACKISH WATER OF THE LAGOONS OF CANANEIA (BRAZIL), (IN GERMAN),
Sao Paulo Univ. (Brazil). Instituto Oceanografico.
V. Sadowsky.
Zool Anz, Vol 191, No 3/4, p 182-183, 1973.
Identifiers: *Brackish water, *Brazil(Lagoons of Cananeia), *Lagoons, Rain, *Sardinella-aurita, *Distribution patterns, Stenohaline fish.

Sardinella spp. are considered stenohaline fish whose distribution is confined to waters with a high salt content. However, young specimens of S. aurita have been seen for 20 yr in the lagoons of Cananeia, where they stay 8-10 mo. until they reach a length of 12-14 cm and have developed gonads, whereupon they return to the sea. Mass deaths of Sardinella occurred on the surface when tropical rains reduced the salt content of the water to 8% up to a depth of 5 m. When rains lower the salt content to the practical limit of 10-12%, the schools of fish leave the lagoons prematurely.--Copyright 1974, Biological Abstracts, Inc.

PARTICULATE MATTER AT THE SEDIMENT-WATER INTERFACE IN COASTAL ENVIRONMENTS,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
R. G. Johnson.
J Mar Res, Vol 32, No 2, p 313-330, 1974, Illus.
Identifiers: Aggregates, Coastal environment, Deposits, *Massachusetts, Minerals, Organic matter, Particulate matter, Quartz, Sediments, *Sediment-water interfaces.

A microscopic study was made of marine sediments to identify the kinds of materials present at the sediment-water interface and to describe these materials from a biological point of view. Fifty-two samples were collected at 26 stations in the vicinity of Woods Hole, Massachusetts. A total of 42 particle species was recognized. Up to 69% of the quartz particles were encrusted with organic matter. All of the samples contained flocculent organic-mineral aggregates in amounts varying from 13 to 71% particle abundance. Nearly all of the clay and silt size particles were incorporated in an organic matrix. The organic-mineral aggregates probably are the products of the recycling of organic matter by deposit feeders. An average of 61% of the particles examined in samples of surficial sediments were potential food particles. The standard methods of describing sediments are inadequate for understanding animal-sediment relations and geological processes. Encrusted particles and organic-mineral aggregates must have different sedimentological properties than clean or free mineral particles. Thus, while the bulk analysis of a sediment may reveal only a few percent organic matter, that may be one of its most important properties.--Copyright 1974, Biological Abstracts, Inc.

COASTAL RESOURCES MANAGEMENT AND CONSERVATION REPORT PUBLISHED,
Pollution Control Guide, Vol 3, paragraph 19733, p 19256-19260, 1974. 5 p.

Descriptors: *Coasts, *Legislation, *Federal government, Jurisdiction, Grants, Economics, Research and development, Conservation, Coastal plains, Coastal marshes, Governmental interrelations, Environmental effects, Comprehensive planning, Resources development, Water conservation, Water resources development.
Identifiers: *Coastal Zone Management Act, Coastal zone management.

The Coastal Zone Management Act provides federal support as an incentive to coastal states, to develop and implement coastal zone management programs within that state. The Act specifies that a state management program must define the boundaries of the coastal zone, list areas of particular state concern, propose a governmental structure to administer the program, and control land and water uses within the coastal zone. The legislation seeks cooperation among federal, state and local governments in dealing with land and water use decisions. Also provided is grant assistance to states for the acquisition, development, and operation of estuarine sanctuaries. Administrative regulations stipulating an allocation formula were made available so that the first grants can be issued by early 1974. Guidelines describing the federal approval process for proposed state management programs are being drafted. (Sperling-Florida)

ROTATING HYDRAULICS OF STRAIT AND SILL FLOWS,
Woods Hole Oceanographic Institution, Massachusetts.
J. A. Whitehead, A. Leetmaa, and R. A. Knox.
Geophysical Fluid Dynamics, Vol 6, No 2, p 101-125, 1974. 8 fig, 11 ref, append.

Descriptors: *Ocean currents, *Atlantic Ocean, *Straits, *Density stratification, *Rotational flow, Weirs, Model studies, Energy equation, Flow, Analytical techniques, Laboratory tests, Theoretical analysis.
Identifiers: *Straits of Gibralter, Cross channel balance, Strait flows, Sill flows.

An understanding of the elementary dynamical schemes of hydraulic rotating flows and laboratory testing were stressed for analyzing observed strait and sill flows. For example, there is tremendous interest in calculating transports and exchanges between the Atlantic Ocean and the Mediterranean Sea through the Straits of Gibraltar. The stratification effects were considered by examining a two-layer fluid. The upper layer is at rest and the lower layer flows from one large basin to another via a connecting channel. The flow was assumed to be principally in a down-channel direction. The flow down the channel or the strait was assumed straight or with little curvature of streamlines. The usual non rotating hydraulic principle of maximum transport in flow over a weir (the end of the channel) was applied and relations between transport, rotation rate, and upstream interface height were calculated. One of these relations was tested experimentally with favorable results. A nonsteady decaying flow in the same system was analyzed similarly and also compared well with experimental results, as did a flow in both layers driven by an initial density imbalance. Some connections with oceanic strait and sill flows were discussed. (Singh-ISWS)

THE WORLD'S LARGEST DESALTING COMPLEX--A REPORT ON TWENTY YEARS EXPERIENCE,
J. Reside, and A. M. S. Al-Adsani.
National Water Supply Improvement Association Journal, Vol 1, No 1, p 1-14, July 1974. 1 fig, 3 tab, 4 ref.

Descriptors: *Desalination, *Potable water, *Foreign research, *Desalination processes, Desalination apparatus, Desalination plants, Descaling, Desalination wastes, Water supply, *Distillation, Flash distillation, Electrodialysis, Evaporators.
Identifiers: *Kuwait.

Kuwait is the largest producer of desalted water in the world. Kuwait presently has 65 mgd of desalting plant capacity and plans another 12 mgd by 1975. The first municipal desalting plant was built in 1953. The original desalting units were the submerged tube type distillation process. The first multistage flash desalting plant was installed in 1960. Currently there are three main plant sites with 24 individual desalting units distributed among them. The units have capabilities ranging from 0.6 to 6.0 mgd. The design, operating procedures, and experiences of these units are described. The by-product recovery and water distribution systems are also described. By-products produced include hydrogen, chlorine, sodium hydroxide, sodium chloride, and hydrochloric acid. Chemical treatment used to reduce the scale formation in the desalting units consists of a mixture of tri-polyphosphate, lignum sulphonate and anti foam. The plants are cleaned manually by water washing and by rods and brushes or they can be cleaned by acid washing. The advanced use of desalting technology in Kuwait has made available an inexpensive supply of electricity and potable water from the sea. (Orr-FIRL)

GEOTHERMAL WELLS IN IMPERIAL VALLEY, CALIFORNIA: DESALTING POTENTIALS, HISTORICAL DEVELOPMENT, AND A SELECTED BIBLIOGRAPHY,
N. El-Ramly, R. E. Peterson, and K. K. Seo.
National Water Supply Improvement Association Journal, Vol 1, No 1, p 31-38, July 1974. 1 fig, 1 tab, 26 ref.

Descriptors: *Geothermal studies, *Desalination, *Energy, *Brines, Brine disposal, Corrosion, Scaling, Temperature, Thermal water, Heat transfer, *California, Potable water.
Identifiers: *Imperial Valley(Calif).

Possible solutions to future water shortages include wastewater reclamation, importation, and desalting of sea or brackish water, but all of these are energy-intensive and energy is also in short supply. A potentially important source of readily available energy is geothermal brine, which is an underground resource found in abundance in the Imperial Valley, California. The background of geothermal well drilling in the Imperial Valley region is presented. Field research is being performed in the areas of heat-exchange technology and geothermal desalting. Brine disposal has been one problem holding back geothermal development. About two pounds of brine are produced for every pound of steam generated. The corrosive and scaling nature of the geothermal brines have stopped large scale commercial development so far. One process appears to offer promise for future developments; the Magmama power process is a vapor-turbine cycle. Hot brine is pumped up from the geothermal reservoir and the phase change of water to steam is suppressed. The brine is cooled in a heat exchanger where it heats a secondary fluid with a low boiling point, such as isobutane or freon, which is then used to drive a turbogenerator in a closed cycle. The cooled brine is injected into a well to maintain the underground reservoir pressures. The establishment of the feasibility of geothermal power in Imperial Valley will provide electrical energy and will better the prospects of a dual purpose geothermal power-desalting project in the Valley. (Orr-FIRL)
W75-04423

UTILIZATION OF THE EARTH'S NATURAL HEATING SYSTEM TO DESALT GEOTHERMAL BRINES FOR AUGMENTATION OF THE COLORADO RIVER SYSTEM,
Bureau of Reclamation, Boulder City, Nev. Region 3.
E. A. Lundberg.
National Water Supply Improvement Association Journal, Vol 1, No 1, p 39-51, July, 1974. 9 fig, 3 tab.

Descriptors: *Geothermal studies, *Desalination, *Brines, *Energy, Thermal water, Potable water, Water resources development, Water quality control, *California, Water supply, Colorado River Basin.
Identifiers: *Imperial Valley(Calif).

The available surface water supplies in the Colorado River Basin are being depleted by increasing agricultural demands and by an expanding population which is using water at a higher per capita rate. Water quality problems also exist in the Imperial Valley, California, because of the presence of highly saline soils and many saline springs which add significant quantities of salt to the river. Geothermal sources stored in the form of a hot brine underground in the Imperial Valley have the potential to yield economical new supplies of fresh water by desalting and also to yield mineral by-products and the production of electricity. A program for water production from the geothermal resources consists of three proposed stages: the research and development stage; the demonstration stage; and, the large-scale development stage. The research and development stage is now in progress and includes extensive geological, geophysical, and water chemistry investigations to determine the potential and extent of the geothermal resource. The demonstration stage would show the viability of large-scale development. The large-scale development stage is the fully operational stage which could augment the Colorado River by several million acre-feet of desalted water annually and would have an associated electric power production. Investigations completed include the drilling of two geothermal wells, one to 8030 feet and the other to 6005 feet and the installation of two desalting test units, a multistage flash unit and a vertical tube evaporator. The proposed next step is the construction of a pilot plant capable of processing 200,000 to 500,000 gallons per day. (Orr-FIRL)

ROCESS AND APPARATUS FOR SEPARATNG WATER FROM NON-VOLATILE OLUTES,
. S. Smith, Jr.
.S. Patent No 3,856,631, 10 p, 5 fig, 13 ref; Offial Gazette of the United States Patent Office, ol 929, No 4, p 1687, December 24, 1974.

escriptors: *Patents, *Distillation, Evaporation, *Electric powerplants, Fresh ater, Sea water, Separation techniques, Desalination.
dentifiers: *Heat of condensation, Immiscible quids, Waste heat.

he apparatus and method for distilling aqueous olutions, especially saline water, for the purpose producing fresh water are disclosed. A heat ansfer medium in the form of a lower boiling imiscible liquid is employed in a manner to give up latent heat of condensation directly to the soluon. The resulting condensate is re-evaporated by at from the resulting fresh water. In this process e immiscible liquid may be denser than, but eferably lighter than water. This method and apratus can efficiently utilize the waste heat of a eam-electric power plant and is able to work tween temperature limits of, for example, 60 g. and 180 deg F. (Sinha-OEIS)
75-04451

ERTICAL, MULTISTAGE-FLASH, FALLING LM COLUMN FOR DISTILLING BRINE,
ciete General d'Entreprises, Paris (France). signee).
Barckhausen.
S. Patent No 3,859,173, 5 p, 8 fig, 8 ref; Official zette of the United States Patent Office, Vol), No 1, p 421, January 7, 1975.

scriptors: *Patents, *Distillation, *Flash distilon, *Desalination, *Waste water treatment, Equipment, Brine, Potable water, Prestressed concrete, Sea water.
Identifiers: Multistage-flash distillation.

A vertical distilling column is made of prestressed concrete. It is comprised of a vertical cylindrical casing, condensing means in its central part and a series of horizontal floors limiting, between them, a number of successive distilling chambers. Each chamber is characterized by the flow in a thin sheet of the brine to be evaporated on its vertical inside wall. Distilled liquid is conveyed on the vertical tubes of the condenser which is situated towards the center and on which are fixed the successive floating floors. The floors have cylindrical symmetry and are installed floating inside the casing. They have two opposite slopes, the one directing the brine towards the periphery, and the other directing the distilled liquid towards the center. Steam-tight sealing of the enclosure is necessary. The prestress necessary for ensuring fluid-tight sealing of the concrete is ensured in the vertical direction by the inside pressure, and in the horizontal direction by outside overpressure and by peripheral cables. (Sinha-OEIS)
W75-04459

METHOD AND APPARATUS FOR PRODUCING A DISTILLATE,
Fried-Krupp G.m.b.H., Essen (West Germany). (assignee)
K. D. Peter.
U.S. Patent No 3,856,632, 5 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1687, December 24, 1974.

Descriptors: *Patents, *Desalination, *Distillation, *Flash distillation, Brackish water, Sea water, Water treatment.
Identifiers: Multi-stage flash evaporator, Flash evaporators.

Improvements in a method of distilling raw water in a multistage flash evaporation system are described. The method includes preheating the raw water in condensers of the flash evaporator, partially evaporating the heated water in a plurality of evaporators connected to the flash evaporator, condensing the evaporated water in condensers connected to each evaporator stage, collecting the condensed vapor from each evaporator stage, removing inert gases from the evaporator stages by means of a vacuum pump (a water or steam ejector), and adding additional heat energy to the raw water by means of a tube-shell heat exchanger. The raw water is conducted from the condensers of the flash evaporator into at least one vertical tube evaporator to partially evaporate it by the addition of heat provided by a heating medium, which is the produced vapor of the vertical tube evaporator that has been removed, compressed to a higher temperature, and returned to the vertical tube evaporator by a heat pump means, to transfer its latent heat to the raw water. The condensed vapor is then passed as a distillate from the vertical tube evaporator to the flash evaporator to transfer part of its liquid heat by stepwise evaporation to the raw water being heated in the condensers of the flash evaporator. The distillate is collected in the trough of the respective stages of the flash evaporator and mixed with distillate from the vertical tube evaporator and removed from the last stage of the flash evaporator. (Sinha-OEIS)
W75-04465

HYDRATE FORMING IN WATER DESALINATION,
Institute of Gas Technology, Chicago, Ill. (assignee)
D. L. Klass.
U.S. Patent No 3,856,492, p 7, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1651-52, December 24, 1974.

Descriptors: *Patents, *Desalination, *Hydration, Sea water, Potable water, Brines, Heat exchangers, Specific gravity, Gases.
Identifiers: *Heat of hydration, *Ice formation.

A process for water desalinization compirses the following steps: commingling in a hydrate formation zone at a temperature above ice formation, brine and a heat-exchange liquid which is substantially immiscible with brine and water, has a specific gravity different from the specific gravities of brine, water and the range there between, and has a dissolved gaseous hydrating agent therein. The hydrating agent is capable of forming a solid hydrate having a specific gravity on the same side of both water and brine as the specific gravity of the heat-exchange liquid and is substantially insoluble in the heat-exchange liquid. The temperature, pressure or a combination of them is adjusted to form a solid hydrate. A portion of the heat of hydration is absorbed by the heat-exchange liquid. Concentrated brine is withdrawn from the hydrate formation zone. The heat-exchange liquid and solid hydrate are withdrawn from the hydrate formation zone to a hydrate decomposition zone. The solid hydrate, aided by the heat of hydration, is transferred directly from the heat-exchange liquid in the decomposition zone, into water and gaseous hydrating agent. The heat-exchange liquid containing gaseous hydrating agent is separated from desalinized water. (Sinha-OEIS)
W75-04466

UNIVERSAL DESIGN OF A 2.5 MGD UNIVERSAL DESALTING PLANT, REVISED: VOLUME 1.
Burns and Roe, Inc., Oradell, N.J.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 920, $7.25 paper copy, $2.25 microfiche. Revised 1974 edition of June 1969, Volume I - Report (193p); Volume II - User's Manual - Part I (92p); Volume III - User's Manual - Part II (144p); Volume IV - Bidding Specification (101p); and Volume V - Technical Specification (288p).

Descriptors: *Desalination plants, Desalination processes, Design criteria, *Flash distillation, *Specifications, *Design standards, *Evaporators, Potable water, Water management(Applied), Treatment facilities, *Fabrication, Water treatment, Waste water treatment.

Design criteria and associated prototype specifications and drawings provide engineers skilled in the water management field with sufficient detailed engineering information to specify, purchase and install a multi-stage flash desalination plant in any location which will produce 2.5 MGD of potable water. Sufficient guidance in operation and startup is provided so that skilled engineers can successfully operate such a plant. The work is limited to the design, specification and cost analysis of the desalting plant only. The large variety of saline water sources, heat sources an distribution arrangements possible precludes their consideration, and so the desalting plant design must be skillfully integrated into the complex by engineers who represent the sponsoring public authority. The revised technical specifications and the user's manual provide information in complete detail to select, specify, purchase and install the desalting plant. The drawings provide all the information needed by steel fabricators to construct the evaporator. The evaporator will deliver the desired potable water output provided additional skills, such as tube rolling, tube sheet machining and other similar work, are available in certain specialized areas. Available from the National Technical Information Service, Springfield, Va. 22161 as PB-239 919-SET, $29.00. Also available as PB-239 920(Vol. 1, $7.25); PB-239 921(Vol. 2, $5.25); PB-239 922(Vol. 3, $7.50); PB-239 923(Vol. 4, $5.25); PB-239 924(Vol. 5, $8.75). Each volume available in microfiche at $2.25 each.

3B. Water Yield Improvement

CONTROL OF GAMBEL OAK WITH THREE HERBICIDES,
Utah State Univ., Logan. Dept. of Plant Science.
G. A. Van Epps.
Journal of Range Management, Vol 27, No 4, July 1974. p 297-301, 3 fig, 1 tab, 13 ref.

Descriptors: *Water yield improvement, Large watersheds, Soil treatment, Herbicides, Oak trees, Ranges, Range grasses, Foliar application, Soil types, Soil water, Utah, Water yield, 2-4-D, 2-4-5-T, Defoliants.
Identifiers: Gambel oak, Picloram, Fenuron.

Prior studies have indicated that Gambel oak (Aqercus gambellii Nutt.) is a species found on watersheds in the Western United States that is a high user of water. Eradication of this species on important watersheds may increase water yields and improve the value of forestry, grazing, and recreation. Three herbicides were applied to Gambel oak on study sites on various exposures and soil types in central Utah. Picloram, fenuron, and phenoxy compounds were applied at various rates and mixtures as soil treatments and foliar treatments in order to attain complete kill of the plant. Fenuron was the only reliable chemical that killed Gambel oak at rates used, but also caused sterilization of the soil and consequent elimination of desirable plants. Foliar spraying with a mixture of picloram and the 2,4-D and 2.4,5-T compounds showed promise in killing Gambel oak crowns. This would open up the rangeland for additional grazing but would contribute little to increased water yields on the watershed. Additional studies are needed to find effective techniques that are more selective in controlling Gambel oak. (Mastic-Arizona)
W75-04366

MANAGEMENT OF PHREATOPHYTE AND RIPARIAN VEGETATION FOR MAXIMUM MULTIPLE USE VALUES,
Forest Service (USDA), Port Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
J. S. Horton, and C. J. Campbell.
Research Paper RM-117, 23 p, April, 1974. 1 tab, 6 fig, 91 ref.

Descriptors: *Phreatophytes, *Southwest U.S., Riparian water loss, Floodplains, Evapotranspiration, *Groundwater, *Evapotranspiration control, Riparian plants, Riparian rights, Flood control, Arroyos, Recreation, Antitranspirants, Perennail streams, Water table, Cottonwoods, Mesquite, Wildlife, Grazing, Multiple purpose, Floodplain zoning, Watershed management.

Information about the relations of vegetation along water courses in the southwestern United States, and impacts on resource values of vegetation management to reduce evapotranspiration is presented. Literature is reviewed on measurement and evaluation of water losses, ecological relationships, usage of phreatophyte areas, and methods for control of phreatophytes. Approaches to floodplain management are discussed, based on floodplain zones which are defined primarily by water table depth, elevation, and tree species. Optimum management requires consideration of both environmental factors and economic needs of the area. Only rarely are there phreatophyte areas in the Southwest that would be best managed by complete vegetation conservation. (Mastic-Arizona)
W75-04379

WOOD BORING INSECT INFESTATIONS IN RELATION TO MESQUITE CONTROL PRACTICES,
Texas Tech Univ., Lubbock. Dept of Range and Wildlife Management.
D. N. Ueckert, and H. A. Wright.
Journal of Range Management, Vol 27, No 5, p 383-386, September, 1974. 4 fig, 2 tab, 13 ref.

Descriptors: *Insects, *Mesquite, *Water yield improvement, *Burning, 2-4-5-T, *Range management, Forage grasses, Texas, Brush control, Moisture content.
Identifiers: *Wood boring insects, Girdling.

Mesquite trees that are infested by wood boring insects are much easier to burn down than uninfested trees. Six different methods of killing mesquite were studied to determine which treatments enhance borer activity. In addition to the control, treatments included aerial spray of 2,4,5-T, and girdling. Basal spraying with diesel oil at 2,4,5-T and girdling resulted in the most significant increase in wood borer activity. Basal spraying with diesel oil and burning resulted in intermediate borer activity; felled trees produced slight activity; and insignificant activity was found in trees sprayed with 2,4,5-T and the control. The use of mesquite control practices which enhance wood borer activity followed by prescribed burning can produce a significant increase in forage production and quality. (Mastic-Arizona)

MORE WATER FOR ARID LANDS, PROMISING TECHNOLOGIES AND RESEARCH OPPORTUNITIES.
Ad Hoc panel of the Advisory Committee on Technology Innovation, Board on Science and Technology for International Development, Commission on International Relations.
National Academy of Sciences, Washington, D.C. 1974. 153 p, 77 fig, 16 chapters, Arabic, French, and Spanish summaries.

Descriptors: *Water harvesting, *Water conservation, *Arid lands, *Irrigation programs, *Irrigation efficiency, Rainfall stimulation, Transpiration control, Evaporation control, Groundwater mining, Artificial recharge, Irrigation, Irrigation water, Water reuse, Percolation, Technology, Desalination, Runoff, Wells, Water wells, Dug wells, Remote sensing, Saline water.
Identifiers: Runoff farming.

Arid lands have an underexploited agricultural potential. This report presents a number of promising technologies and research opportunities which may play a role in supplying needed water. Two approaches are considered: increasing the supply of usable water, and reducing the demand for water. Technologies discussed include: rainwater harvesting, runoff agriculture, irrigation with saline water, reuse of water, wells, other sources such as desalting, weather modification and groundwater mining, evaporation reduction, seepage loss, trickle irrigation, innovative irrigation methods, reduction of percolation losses, transpiration reduction, use of more water-efficient plants for agriculture, controlled-environment agriculture, and some promising water conservation techniques such as artificial recharge of groundwater. (Mastic-Arizona)

WATER RIGHTS AND ASSESSMENTS, (PROPOSALS INVOLVING ANTARCTIC ICEBERGS FOR THE COLORADO RIVER BASIN, CALIFORNIA, MEXICO AND OTHER ARID LANDS),
J. L. Hult.
(Rand Corporation), p 5271, July, 1974. 14 p, 5 ref.

Descriptors: *Water resources development, *Water supply development, *Arid lands, *Icebergs, Water rights, Water allocation(Policy), Water quality, Water law, Cost allocation, Antarctic, Water costs.

Some principles are presented with the purpose of proposing solutions to water rights and cost allocation problems associated with the use of Antarctic icebergs as a fresh water resource in the Colorado River Basin, California, Mexico, and other arid lands. The adoption of the proposed principles would provide unrestricted nondiscriminitory access to water anywhere and would therefore facilitate the initiation and evolution of water use for the greatest world-wide economic benefit. It would relieve the unfair competition and subsidy from established water users, recognize the value of water quality, and offer opportunities to improve water quality. The principles offered would encourage the development and implementation of new technologies and enable the employment of the world's largest reserves of fresh water, the Antarctic icebergs which would otherwise continually waste away. ATMOSPHERIC WATER RESOURCES MANAGEMENT PROGRAM - BRIDGER RANGE CLOUD SEEDING EXPERIMENT,
Montana State University, Bozeman. Dept. of Earth Sciences.
A. B. Super, J. A. Heimbach, J. T. McPartland, and V. L. Mitchell.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-234 012, $10.50 in paper copy, $2.25 in microfiche. REC-14-06-D-6798, p 416, April 15, 1974. 15 fig, 54 tab, 32 ref, 3 append. Contract No 14-06-D-6798.

Descriptors: *Cloud seeding, *Artificial precipitation, Artificial storms, Precipitation(Atmospheric), Meteorology, Precipitation gages, Radiosondes, Snow management, Storms, Weather, *Weather modification, Winds, Meteorology, Clouds, Silver iodide, Topography, Snow packs, Water equivalent, Snowfall, Orography, *Montana, Water resources.
Identifiers: Silver iodide generators, *Bridger Range(Mont).

Discussed were winter cloud seeding experiments conducted in the Bridger Range of southwestern Montana, and the analysis of a three-winter radomized seeding experiment. Also considered was airborne plume tracing of silver iodide over and downwind of the Bridger Range, confirming earlier work indicating that tareting was usually successful with westerly flow. Several studies discussed support the statistical analysis of the randomized cloud seeding experiment. These include a stepwise multiple regression analysis relating nonseeded precipitation to upper air parameters. Cloud thickness was most closely related to snowfall of the parameters considered in this analysis. Snowfall amounts and frequency were greatest during nighttime at mountain stations. Pooling daytime and night-time 6-hour precipitation totals to increase sample size for statistical analysis was not valid. Attempts to utilize a target-control analysis were unseccessful due primarily to lack of a control gage adequate for this type of analysis. Application of nonparametric statistical tests to 6-hour precipitation totals did not indicate seeding effects. (Jones-ISWS)

A COMPENDIUM OF INFORMATION, (THE METROPOLITAN TORONTO AND REGION CONSERVATION AUTHORITY).
Metropolitan Toronto and Region Conservation Authority, Woodbridge (Ontario).
December 31, 1972. 102 p, 1 map, 49 ref.

Descriptors: Conservation, *Water conservation, *Flood control, *Land management, *Resources development, *Canada, Fish conservation, Wildlife conservation, Forest management, Land use, Lake Ontario, *Comprehensive planning.
Identifiers: *Toronto(Canada).

The Authority, created by the national government to develop a comprehensive program of resource management, has jurisdiction over 1126 square miles, an area defined by the watersheds of all streams entering Lake Ontario between Etobicoke and Carruthers Creek. Its 55 appointed members formulate and administer programs through 10 boards which deal with various conservation areas. Much of the enforcement depends on funding by the government. Accomplishments and goals are outlined for: flood control and water conservation; reforestation and land used including fish and wildlife management; recreation program; a water development program; land acquisition, acquisition and development of Niagara escarpment, information and education, historical planning; and ancillary conservation measures. The financial foundation of the Authority and its relationship with the different levels of government are discussed. The Metropolitan Toronto and Region Waterfront Plan 1972-76 undertaken by the Authority, prepared on the basis of $4 million per year expenditure for 5 years, is now operative and involves acquisition and development of sites for land fills, parks, conservation areas. The policy of the Authority concerning the planning, development and management of the waterfront of Lake Ontario is given. All of the proposed projects will be carried out within the context of planning and land use controls in force which, under the Planning Act, are administered by the municipalities in which the works are to be located. (Salzman-North Carolina)

LIVING CITY, (MELBOURNE, AUSTRALIA, REVIEW OF OPERATIONS, 1972-73).
Melbourne and Metropolitan Board of Works, (Australia).
Report No 14, Spring/Summer 1973. 24 p, 9 fig, photos.

Descriptors: Water resources, *Planning, Forest watersheds, Runoff, *Water supply, *Water storage, *Sewers, *Reservoirs, Expenditures, Hydrology, Electricity, Electrolysis, Corrosion, Preservation, Dams, Environment, Sites, Administration, Efficiency, Capital costs, Budgeting, *Australia, Water yield improvement.
Identifiers: *Melbourne(Aust), Water retriculation, Policy analysis, Creeks, Cardinia Reservoir(Australia), Renewal.

Eight articles relating to water resources in the Melbourne area are summarized: (1) In order to evaluate the present policy of closed or single use catchments for managing the limited areas which yield water, the forestry staff of the Melbourne and Metropolitan Board of Works (MMBW) analyzes runoff from different types of forest areas, and conducts forest hydrology research to study vegetation-water relationships to determine whether a multiple use policy can be safely adopted without detriment to Melbourne's water supply. (2) Stray electricity from train and tram services creats a problem for water supply engineers due to electro-chemical corrosion of pipes of the water reticulation system. (3) A community clean-up group, coordinated by MMBW is working to change the creeks which have become rubbish choked eyesores back into parkland areas and storm water channels. (4) The Cardinia Reservoir experience provides insight into the planning that goes into the siting of a water storage dam, and once built, how the new environment is shaped. Important factors in site selection are reliable flow of water, topography, impermeable underlying rocks and soils, and availability of construction materials on site. (5) Renewal of original 80-year old sewers presented a problem. (6) The history of Melbourne's first reservoir, conceived by engineer James Blackburn and completed in 1857 is presented. (7) MMBW moved to new head office for 2,300 staff in August 1973, facilitating more efficient central administration and extended use of the computer. (8) Major expenditure in capital works program for 1973/74 is water supply augmentation and major sewerage works. Also included is a review of 1972/73 operations wherein capital expenditures exceeded $100 million. (Diefendorf-North Carolina)

THE DESIGN AND PROMOTION OF A SCHEME USING MIXED WATER FROM THE RIVERS ANCHOLME, WITHAM AND TRENT FOR INDUSTRIAL SUPPLY TO HUMBERSIDE,
Rofe, Kennard and Lapworth, London(England).
M. Lindley, F. J. Bowyer, and H. S. Hawkins.
Journal of the Institution of Water Engineers, Vol 28, No 5, p 272-298, July, 1974. 3 fig, 7 ref.

Descriptors: *Water importing, *Water demand, *Water supply, *Water management(Applied), *Water conveyance, Water utilization, Water conservation, Water delivery, Economics, Rivers, Bodies of water, Inland waterways, Watersheds, Management, Planning, Economic impact, Industrial plants, *Industrial water, Costs.
Identifiers: *Inter-river transfer works, North Lincolnshire(Eng), River Ancholme(Eng), River Witham(Eng), River Trent(Eng), National Water Plan(Eng), New towns, Humberside(Eng).

To accommodate rising water demand for industrial purposes, a major inter-river transfer scheme involving two river authorities and the North Lindsey Water Board in England was devised. Transfers are first made from the river Witham, and then from the river Trent via the river Witham; this water transfers to the river Ancholme in North Lindsey. Water quality concerned industrialists, who need water for demineralization and cooling processes. The proposed source change required changes in the newly-constructed treatment plant, increasing costs for chemicals and water. To meet opposition by industrialists, the Water Board had to initiate the distribution system ahead of the intended schedule. A new town and rapid industrial development following construction of the Humber Bridge were forecast for the area by the National Water Plan, so flexibility in the scheme is important if it was to coincide with future water development. This scheme may be the forerunner for other similar programs, and lessons learned in its planning and operation should be valuable to future planners. Little was known, for example, about what effect the quality and cost of the supply would have on water demand. (Grden-North Carolina)

USE OF LEAF RESISTANCE FOR PREDICTING IRRIGATION SCHEDULING,
Kansas State Univ., Manhattan. Dept. of Agricultural Engineering.
A. Chen.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 342, $4.25 in paper copy, $2.25 in microfiche. Kansas Water Resources Research Institute, Master's Thesis, 56 p, 1972. 21 fig, 2 tab, 3 append 42 ref. OWRT A-044-KAN(1).

Descriptors: *Soil water, *Sorghum, *Irrigation, *Sprinkler irrigation, *Soil-water-plant relationships, Leaves, Soil moisture, Tensiometers, Transpiration, Water requirements, Meteorological data.
Identifiers: Soil water potential, Leaf diffusion porometer.

Objectives of this study were to find the characteristics of leaf resistance in sorghum plants, to develop a relationship between soil water potential and leaf resistance, and to evaluate the use of leaf resistance as a criterion for irrigation scheduling. Leaf resistance was reassured both on field and potted plants by a leaf diffusion porometer. resistance was found to be high at the base of the leaf and low at the tip. The leaf resistance readings taken during the growing season were found to correspond closely with the soil water potential at 45 cm of depth. From potted plants measurements, a rapid increase in average leaf resistance occurred at a soil water potential of -5 to -6 bars. This corresponds to 50 percent of available soil water, the level at which irrigation should be initiated to provide adequate moisture for optimum grain growth. (Mastic-Arizona)

IRRIGATION, ROW WIDTH, AND PLANT POPULATION IN RELATION TO GROWTH CHARACTERISTICS OF TWO SOYBEAN VARIETIES,
Auburn Univ., Ala. Dept. of Agronomy and Soils.
B. D. Doss, and D. L. Thurlow.
Agronomy Journal, Vol 66, No 5, p 620-623, September-October, 1974. 5 tab, 2 fig, 8 refs.

Descriptors: *Irrigation, *Plant populations, *Alabama, *Crop production, Soil water, Soybeans, Stress, Regime, Plant growth, Field capacity, Southeast U.S.

Water stress at critical growth periods appears to be one of the most frequent limiting factors in soybean production. The effects of soil water, row width, and plant population on water use, growth rate, and bean yields of two soybean varieties were examined in central Alabama. Irrigation and bean variety influenced bean yields more than row width or plant population which showed little influence. Water use rates by soybeans were affected more by soil water regime than high irrigation amounts. Soybean plants appear to recover quickly even after showing severe signs of water stress by wilting or slow growth rate. This characteristic reduces the chances of a high response to irrigation. It is doubtful that irrigation of soybeans would be economical in most years. (Mastic-Arizona)

PATTERN OF WATER AVAILABILITY AND WATER REQUIREMENT FOR GRAIN SORGHUM PRODUCTION AT SAMARU, NIGERIA,
Institute for Agricultural Research, Zaria(Nigeria).
J. Kowal, and D. J. Andrews.
Trop Agric. Vol 50, No 2, p 89-100. 1973 Illus.
Identifiers: Climates, *Grain sorghum, Growth rates, Hybrids, Irrigation, *Nigeria(Samaru), Rainfall, Sensitivity, Soils, Sorghum-bicolor, Temperature, *Crop production, *Water requirements, *Water availability.

The performance of rain-fed sorghum (S. bicolor (Moench)) in a dry sub-humid region of northern Nigeria is analyzed in terms of adaptability to climate with particular reference to crop water availability. The water requirement of a 'Short Kaura' sorghum crop is about 700 mm. The average annual rainfall of 1100 mm is distributed over 140 to 160 days. The water storage capacity of the soil is adequate to provide the water requirements of sorghum after the end of the rains and to extend the growing season by about 60 days. The pattern of the crop water requirement is then well matched to the pattern of water availability for rain-fed sorghum production. The indigenous long season sorghum varieties are photosensitive and their heading coincides with the end of the rains when grain formation is dependent on the reserves of stored soil moisture. These varieties have a low grain yield potential and the period of vegetative growth is too long for efficient grain production a high levels of fertility. High growth rates during the 1st 9 wk suggest that the crop could be used for forage production. Non-photosensitive exotic sorghums (i.e., American hybrids and combine varieties) have short seasons relative to Nigerian varieties and give high grain yields, but a quality unacceptable for human consumption in Nigeria. Sown at the beginning of the rains, the crop ma tures at the peak of the rainy period rendering har vest difficult. Because of wet harvest condition the grain quality is poor. Late sown crops are dif ficult to establish; the yields are lower than those from early sowings. Production of local sorghum under irrigation during the dry season is not possible at Samaru because of low temperatures.

CHANGES IN TRANSPIRATION, NET CARBON DIOXIDE ASSIMILATION AND LEAF WATER POTENTIAL RESULTING FROM APPLICATION OF HYDROSTATIC PRESSURE TO ROOTS OF INTACT PEPPER PLANTS,
Connecticut Univ., Storrs. Dept. of Plant Science
B. E. Janes, and G. W. Gee.
Physiol Plant, Vol 28, No 2, p 201-208, 1973, Illus
Identifiers: Aperture, Capsicum-annuum, *Carbon dioxide, Flow, Hydrostatic pressure, Light, Mesophyll, *Pepper plants, Roots, Stomatal, *Transpiration, *Leaf water potential, Absorption.

Hydrostatic pressures varying from 0-6.0 bar were applied to roots of intact Capsicum annuum L. 'California Wonder' plants growing in nutrient solution and the rates of transpiration. and net CO2 assimilation, apparent compensation point and leaf water potential measured. Increasing the pressure on the roots of plants with roots in solution with either -0.5 or -5.0 bar osmotic potential with 1 bar increments resulted in a decrease in transpiration. With the application of 1 or 2 bars pressure the rate of transpiration returned to near

or above the original rate. An application of 3 or 4 ar pressure reduced the rate of transpiration of all lants. The transpiration of plants with roots in olution with -0.5 bar osmotic potential remained t the reduced rate for as long as these pressures ere maintained. The transpiration of plants with oots in solution with -5.0 bar was only temporarily uppressed at these pressures. Changing the aplied pressure from 3 or 4 bar to 0 resulted in a apid increase in transpiration which lasted approximately 15 min. This was followed by a ecrease in transpiration to a rate lower than bere the pressure was applied. The pattern of esponse was similar for plants at low or high light tensity or at normal or low CO2 concentrations. hen leaf diffusive resistance was 6.0 s cm to the inus 1 or greater, changes in net CO2 assimilaon were similar to those of transpiration. The arent CO2 compensation point increased as presre was applied and decreased with a release in essure. Leaf water potential increased with an crease in pressure and decreased with a decrease pressure.--Copyright 1974, Biological Abstracts, c.

ECT OF QUALITIES OF IRRIGATION TER AND FERTILIZERS ON SOIL PROTIES, YIELD AND NUTRIENT UPTAKE BY CAT,
N. Coll. of Agriculture, Jobner (India). Dept. ricultural Chemistry and Soil Science.
l, and K. S. Singh.
n J Agric Sci, Vol 43, No 4, p 392-400, 1973.

riptors: Alkalinity, *Fertilizers, *Irrigation , *Nutrients, Salinity, *Soil properties, um-aestivum, Water quality, *Wheat yield, rption.

d experiment was conducted for 2 yr with 3 of water and 3 fertilizer levels on the same of loamy-sand soil with similar layout to determine the cumulative effect of poor quality or irrigation waters on wheat (Triticum aestivum L.). In both the years 'RS 3-1' cultivar was grown. At the end of the experiment, the ECe of the soil was less than the electrical conductivity (EC) of the irrigation water. After the rainy season, there was a drastic reduction in the ECe (EC of saturation extract) values of the soil. The SAR, pH and ESP (exchangeable Na percentage) of the soil at all depths increased with an increase in the SAR of the irrigation water. After the rainy season, there was a marked reduction in the SAR, ESP, pH and hydraulic conductivity values of the soil at all depths. The main effects of fertilizer doses on soil properties were significantly not different in both the years at all depths. The grain and straw yields and the uptake of N, P, K, Ca and Mg decreased with a rise in the EC and SAR of waters, but they increased with an increase in the level of fertilizers. The response of fertilizers on yields was negated when the salinity and alkalinity of the waters were excessively high (EC 7.0 mmhos/cm, SAR 25.97). Fertilization would be beneficial if the EC and SAR of water are up to 3.45 mmhos/cm and 16.73, respectively.--Copyright 1974, Biological Abstracts, Inc.

SUSCEPTIBILITY OF GRAIN SORGHUM TO WATER DEFICIT AT THREE GROWTH STAGES,
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
R. B. Lewis, E. A. Hiler, and W. R. Jordan.
Argon J, Vol 66, No 4, p 589-591, 1974.
Identifiers: *Grain sorghum, *Growth rates, Irrigation, *Soil water deficit, Sorghum-bicolor, Susceptibility, *Water loss, Crop production, Vegetation.

Susceptibilities of grain sorghum (Sorghum bicolor (L.) Moench, cv. 'Oro') to a moderately severe soil water deficit were determined. The crop susceptibility was expressed as the fractional reduction in yield caused by a given soil-water potential at a particular growth stage as compared with a well-watered control. The soil-water potential was allowed to drop to -12 to -13 bars during one stage of growth only, while being maintained above -0.7 bar during the remainder of the growing season. This level of soil-water deficit resulted in yield reductions of 17, 34 and 10% when the deficit occurred during the late vegetative to boot stage, the boot through bloom stage, and the milk through soft dough state, respectively. These values were compared with values calculated from data reported in the literature and discussed in terms of applicability in irrigation timing.--Copyright 1974, Biological Abstracts, Inc.

THE DESIGN OF A LIVESTOCK WATER DISTRIBUTION SYSTEM--LARGE SCALE,
Nebraska Univ., Lincoln. Agricultural Experment Station.
H. R. Mulliner.
Transactions of the ASAE, American Society of Agricultural Engineering. Vol 17, No 3, p 436-439, May-June 1974. 2 fig, 3 tab, 4 ref.

Descriptors: *Water distribution(applied), *Design, *Planning, Livestock, Cost analysis, Economics, Engineering, Feasibility, Flexibility, Sites, Inspection, Water demand, Water requirements, Piping, Size, Pumping, Equipment, Materials, Construction, Operation and maintenance, Installation, Evaluation, Domestic water, Alternative planning, *Nebraska, *Distrubution systems.

The design procedure used to develop a large-scale livestock water distribution system for the U.S. Meat Animal Research Center in Nebraska is summarized. The format was general to allow system flexibility; however, minimums were considered to safeguard the final system operation and insure adequate sanitation. This format was divided into four phases. Phase 1 was general, wherein objectives were defined and available facilities and their requirements were recorded on a detailed map. Phase 2 was a specific site inspection; data were collected, capacities of existing facilities were determined, domestic water demands were estimated, fire protection and soil characteristics were examined, and alternative water system layouts were considered. Phase 3 was a preliminary report summarizing findings from Phase 2 and considering system design factors, such as: water demand and the demand interval; water delivery at design rate; peak water demand rates, pipe size, and pumping requirements; water quality standards; and type of piping and installation method. A cost analysis of equipment and pipes was completed to evaluate the alternative systems prior to recommending a system design to the Center. Phase 4 was the final engineering report, including all information pertinent to planning and installing the system. Installation-, operation-, and maintenance-flexibility were found to be the most important design considerations. Initial depreciation costs were considered secondary to functional operation of a water distribution system. (Bell-Cornell)

ADOPTION OF NETWORK TECHNIQUES IN THE PLANNING AND EXECUTION OF IRRIGATION AND POWER PROJECTS,
Hindustan Construction Col. Ltd., Bombay (India).
K. M. Kulkarni.
Irrigation and Power, Vol 30, No 3, p 273-288, July 1973. 6 fig, 4 tab.

Descriptors: *Irrigation, *Projects, *Planning, *Management, *Critical path method, *Scheduling, Rivers, Diversion, Diversion dams, Hydroelectric power, Construction, Computers, Costs, Mathematical models, Systems analysis, *Networks, Risks.
Identifiers: Network techniques, Project control, Site control, Power projects, Multiobjective.

'PERT' (Program Evaluation and Review Technique) and 'CPM' (Critical Path Method) are versatile planning and management tools which form a part of Network Management Technique (NMT). The introduction of network techniques to irrigation and power projects is discussed; also, the developments of CPM and its application to the Yamuna Hydro Electric Project, Stage II, by the Hindustan Construction Co. Ltd., in its work of river-diversion for construction of Ichari Dam. The network technique is admirably suited to the construction industry, particularly for river valley projects where the nature of project execution involves many processes and uncertainties and where the construction period is limited to only 6 to 8 months per year. In the construction industry, as the time estimates are more deterministic, CPM

is more often used. The use of CPM in project scheduling is discussed. The following aspects of network modeling are studied: drawing and preparing the network; the reporting system of progress of the model; feedback information for corrective measures for effective control of the project; and resource analysis. The use of PERT/COST in developing a project cost control plan is examined; the method is found to improve program management by providing more accurate forecasts of time and cost required to accomplish objectives and better measurement of progress in meeting the scheduled costs and technical objectives. Finally, the use of computers for PERT/CPM network management is considered. (Bell-Cornell)

DRAINAGE FOR AGRICULTURE,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
Number 17 in the series AGRONOMY. American Society of Agronomy, Inc., Madison, Wisconsin, 1974. J. Van Schilfgaarde, Ed., p 700, 225 fig, 64 tab, 1,045 ref.

Descriptors: *Drainage, *Agriculture, *Flow, *Soils, *Water management(Applied), Crop production, Salinity, Land use, Design criteria, Humid areas, Materials, Construction, Saturated flow, Steady flow, Unsteady flow, Wells, Drains, Water table, Salts, Effects, *Water quality, Drainage water, Chemicals, Nutrients, Groundwater movement, Analog models, Hydraulic models, Digital computers, Finite element analysis, Soil properties, Networks, Mathematical models, Systems analysis, Europe, United States.
Identifiers: Flat areas, Drain tubes, Heterogeneous media, Drain envelopes, Drainage analogues, Finite difference methods.

This monograph is the second volume in a series devoted to drainage, the improvement of soil water conditions to enhance agricultural land use. It stresses developments in agricultural drainage since 1957 and covers a highly comprehensive area. The effects upon crop production of drainage and their translation into design criteria are discussed. Current engineering practices in the USA and Europe are reviewed and recent developments in construction techniques are described. Five chapters deal with the theory of drainage flow systems, attempting to interpret these theories in terms of practical applications. Current increased concern with water quality has led to the inclusion of a detailed discussion of soil and water quality in relation to drainage as well as of drainage water quality. The increasing availability of computers has warranted four chapters on physical and mathematical models, including analogues and hydraulics. The application of drainage theory requires a knowledge of the pertinent soil properties; the discussion herein emphasizes field methods and practical applications of theoretical concepts. Finally, the use of systems techniques to solve broad-based water management problems is considered. (Bell-Cornell)

WATER MANAGEMENT SYSTEMS,
Technion--Israel Inst. of Tech., Haifa.
N. Buras.
In: Drainage for Agriculture, Jan Van Schifgaarde, Ed., Number 17 in the Series AGRONOMY, American Society of Agronomy, Inc., Madison, Wis., 1974, p 675-694, 3 fig, 5 tab, 35 equ, 15 ref.

Descriptors: *Water management(Applied), Agriculture, *Drainage, *Irrigation, *Salt balance, *Soils, *Simulation analysis, *Design criteria, Root zone, Crops, Annual, Salinity, Precipitation, Evapotranspiration, Leaching, Hydrology, Arid lands, Evaluation, Optimization, Equations, Systems analysis, Mathematical models.
Identifiers: Systems engineering, Conjunctive operation, Moisture control, Uncertainty.

The design of soil moisture control systems should include comparison of possible alternatives and selection of the design which optimizes the decision criterion. This can be accomplished using an analytical model incorporating physical, engineering, probability and risk, and crop value aspects. Water management in agriculture is accomplished by fairly complex systems. The two major components of these systems are the irrigation subsystem and the drainage facilities. In order to insure the effectiveness of the entire system, these two components must be designed, constructed, and operated conjunctively. Systems engineering is used to analyze an irrigation-drainage problem where the salt balance in the root zone is an important aspect of the environment in which crops are grown. An annual model is derived, which indicates the changes in soil salinity during a yearly cycle as a function of the precipitation and irrigation quantities and salinity. To evaluate separately the effects of the natural precipitation and those of irrigation, a two-season model is developed, which may be used for designing water management systems. Finally, four sets of criteria for evaluating water management systems are identified and discussed: physical (technical), economic, social, and environmental. (See also W75-04537) (Bell-Cornell)

COMPARISON OF BANDED AND BROADCAST FERTILIZER APPLICATIONS IN RELATION TO COMPACTION AND IRRIGATION IN MAIZE AND WHEAT,
Punjab Agricultural Univ., Ludhiana (India). Dept. of Soils.
M. R. Chaudhary, and S. S. Prihar.
Agron J. Vol 66, No 4: p 560-564. 1974 Illus.
Identifiers: Banded fertilizers, Broadcast fertilizer, Compaction, *Fertilizers, Growth rates, Irrigation, Loan, Nitrogen, Nutrients, Phosphorus, Potassium, Sandy, Seed, Seedling, Soils, Tricitum-Aestivum, *Wheat, Zea-Mays, *Corn(Field), Absorption.

For maximum utilization of applied nutrients, the zone of nutrient concentration and root activity must synchronize. Since irrigation and compaction influence nutrient mobility and root configuration, their effect on growth and nutrient uptake were studied under different methods of fertilizer application in deep sandy loam and loamy sand soils. In studies with maize (Zea mays L.) and wheat (Triticum aestivum L.), fertilizer was banded or broadcast with and without irrigation and interrow compaction. Because seedling growth was faster when fertilizer was placed 20 cm below the seed, this treatment ultimately resulted in higher grain yield than when fertilizer was broadcast. In 1970, placement of fertilizer P was banded alone and increased corn yield by 40% while in 1971, placement of NPK increased maize yield by 170% over broadcast. The differences were greater with interrow compaction. Compared with broadcast, band placement of NPK increased the yield of irrigated wheat by 48% and 26% and that of unirrigated wheat by 288% and 150% with and without compaction, respectively. Treatment effects on nutrient uptake followed the same trends as those on grain yield. Fertilizer should not be broadcast where root growth in the surface layers is likely to be restricted due to surface drying or compaction. In compacted plots, heavy and infrequent irrigations appeared to be desirable because they resulted in significantly higher uptake of N. In the absence of compaction, nutrient uptake in the 2 irrigation practices was similar but grain yields were higher with frequent light irrigations than with frequent heavy irrigations. EFFECTS OF FERTILIZER AND AVAILABLE MOISTURE ON THE YIELD AND N AND P CONTENT OF WHEAT AND ON SOIL NUTRIENTS,
Department of Agriculture, Swift Current (Saskatchewan). Research Station.
W. C. Hinman.
Can J Soil Sci. Vol 54, No 2. p 187-193. 1974.
Identifiers: *Fertilizers, *Moisture content, Nitrate, *Nitrogen, Nutrients, *Phosphorus, Soil nutrients, Wheat, *Crop production.

That cher wheat was grown in tank-type lysimeters over a 7-yr period to determine the effect of fertilizer, 2 levels of available water and 2 cropping systems on the yield and nutrient content of grain and on some soil nutrients. Fertilizer did not change the yield of grain materially under natural rainfall. Added water only increased the yield by 1/2 and 3/4 of continuous wheat and fallow, respectively. Fertilizer with added water nearly doubled the yield of continuous wheat and increased by 1/3 the yield from the wheat-fallow rotation. The P content of the grain was not affected by fertilization, but was higher in the treatments to which additional water was applied than in those receiving natural rainfall only. It was also higher in continuous wheat than in fallow wheat. There was an interaction between the N and P uptake ratio and the N content of the grain. Fertilizer or additional water or both increased or decreased the N content, depending upon which way the N or P balance was shifted. Surplus available N not utilized by the crop grown with natural rainfall accumulated as nitrates at lower soil depths, particularly under the wheat-fallow system. Al the NO3-N produced where supplemental water or water and fertilizer were applied was utilized and non ac cumulated. The organic N content of the surface soil increased along with a reduced loss in organic C where water and fertilizer were applied, as compared to the other treatments. Fertilizer application resulted in a sharp increase in NaHCO3 soluble P, particularly following the supplemental water plus fertilizer treatments where an excess of P was supplied with the fertilizer over that removed by the crop. There was an increased demand on soil P where water only was applied, and the soluble P content was appreciably reduced. Copyright 1974, Biological Abstracts, Inc.

FLOOD HAZARD REPORTS: TOOLS FOR RESOURCE PLANNING AND MANAGEMENT,
Soil Conservation Service, Grand Rapids, Mich.
T. A. Ringler, and J. H. Kennaugh.
Journal of Soil and Water Conservation, Vol 29, No 4, p 182-185, July/August, 1974. 2 fig, 8 ref.

Descriptors: *Flood plains, *Flood forecasting, Flood data, *Flood control, Flood plain zoning, Flood plain insurance, Flood protection, Legislation, Regional flood, *Planning, *Management.
Identifiers: Flood plain management, Flood hazard reports.

The mechanics and advantages of flood hazard reports are discussed. Flood hazard studies consist of two major technical reports. The flood plain areas subject to flooding by select-frequency floods are outlined on aerial photomosaics and soil survey information that identifies the different types of soils within the flood-plain and its surroundings are also shown on the photomosaic maps. The reports contain soil descriptions and interpretative data. Flood hazard reports provide local and state governments and community residents with a technical basis for carrying out flood-plain management programs. Suggested nonstructural measures for flood-plain management resulting from legislation and flood hazard reports include flood-plain zoning ordinances, flood-plain development regulation, flood-plain filling regulation, flood insurance program, open space acquisition, upstream land treatment, and regional land use planning. Structural corrective measures include runoff-retarding dams, levees or walls, channel improvement, and flood-proofing. The key to developing technical data for flood planning programs is cooperation between city, county, regional, state, and federal agencies. Successful metropolitan resource management programs must ignore political boundaries. (Orr-FIRL)

Since 1967 the ASCE Program has served as the full-time operating arm of the American Society of Civil Engineers Urban Water Resources Research Council. The basic purpose of the Program is to help establish coordinated long-range research on urban water resources on a national scale. Briefly summarized is the progress made through mid-1974, on research needs assessment, urban water management, translation of research findings into practice, facilitation of urban runoff research, and collaboration and participation in research of local governments and other organizations. Also noted are activities scheduled for 1974-1975. Included are one-page abstracts for all twenty-eight Program reports and technical memoranda. (McPherson-ASCE)

A TWO-DIMENSIONAL MULTI-STAGE PROGRAMMING MODEL: WITH APPLICATION TO RESERVOIR SYSTEMS,
Army Construction Engineering Research Lab., Champaign, Ill.
O. E. Rood, M. I. Dessouky, and D. D. Meredith.
November 1974, 27 p, 3 fig, 8 ref, append.

Descriptors: *Multiple-purpose reservoirs, *Dynamic programming, *Cost analysis, Flow, *Reservoir storage, *Hydrologic data, Water policy, Reservoir operation, Optimization, Constraints, *Networks, Equations, Algorithms, Evaluation, Mathematical models, Systems analysis.
Identifiers: Multi-stage programming, Time-and-distance programming, Grid size, Benefit maximization.

A simultaneous time- and distance-staged programming approach is developed for determining the optimal, time dependent, storage and flow policies in a network with only feed-forward flow connections and nonlinear cost functions. The approach is applied to a multipurpose reservoir system which is subject to time varying demands, prices, availabilities, and movement restrictions. The model is a two-dimensional extension of the concepts of dynamic programming through the definition of partial multidimensional recursive relationship. This reduces the size of the state space. The conditions for global optimality are presented, which include separable and concave cost functions. These conditions are seldom restrictive in the operating environment of large scale multipurpose reservoir systems. The computational results indicate that the approach is efficient in computer memory requirements and computation time. (Bell-Cornell)

EXPECTATION AND DISPERSION MATRICES FOR THE ESTIMATION OF DISTRIBUTIONS ASSOCIATED WITH DISCRETE RESERVOIRS,
Natal Univ., Durban(South Africa).
G. G. S. Pegram.
Journal of the Royal Statistical Society, Vol 36, No 2, p 299-304, 1974. 2 ref.

Descriptors: *Reservoir storage, *Stochastic processes, *Estimating, Reservoirs, Design, Markov processes, Equations, Mathematical models, Systems analysis, Disperion, Distribution systems.
Identifiers: *Stochastic reservoir theory, Linear approximations, Maximum likelihood, Input transition probability matrix.

Reservoir design problems involving chance fluctuations currently rely heavily on simulation for their solution. However, Stochastic Reservoir Theory, which employs finite Markov chains for the solution of problems associated with single reservoirs, is expressible in matrix form and thus lends itself to fast solutions using a digital computer. Stochastic Reservoir Theory can be useful in the analysis of small systems, as a precursor or an adjunct to simulation. In the case of a particular input transition probability matrix model, approximate expressions are found for the mean and dispression matrix of its elements and of the elements of the storage distribution for Moran and Lloyd reservoirs. The discussion is confined to stationary, non-seasonal models and is therefore to be regarded as only a preliminary survey. (Bell-Cornell)

COMPUTER USE FOR RIVER REGULATION,
Corps of Engineers, Portland, Oreg. North Pacific Div.
C. E. Abraham.
Journal of the Hydraulics Division, American Society of Civil Engineers Vol 101, No HY2, Proceedings paper No 11140, p 291-297, February 1975. 3 fig, 6 ref.

Descriptors: Water resources, *River regulation, *Hydrologic data, *Hydroelectric power, *Computer programs, *Simulation analysis, *Multiple-purpose reservoirs, Scheduling, Reservoir operation, Reservoir storage, Constraints, Streamflow, Design, Optimum development plans, Projects, Columbia River, Water policy, Forecasting, Equations, Mathematical models, Systems analysis.
Identifiers: *Computer applications, Data communication.

The complexity that occurs in regulating multiple-purpose reservoir systems has necessitated the use of computer programs for scheduling reservoir regulation. The need for real-time use of scheduling computer programs coupled with the aforementioned complexity has made automated regulation schemes and interactive computer processing highly desirable. The scheduling engineer must be able to examine easily the results of a trial computer simulation and modify operating constraints and forecasted information as necessary to retry the simulation. A package of stand-alone computer programs with interfacing capability is considered. These programs are used in real-time reservoir regulation and streamflow forecasting analyses in the North Pacific Division office of the Corps of Engineers. Since the simulated operation is sensitive to given target elevations, target ranges guide the operation along desired operating policies while recognizing physical system and project constraints. No optimization procedures are used, but experience indicates that the target technique used to simulate reservoir regulation coupled with the interactive computer processing features effectively provides a tool for finding optimum multiple-purpose operation policies within actual operating constraints. (Bell-Cornell)

OPTIMAL OPERATION OF MULTIPLE RESERVOIR SYSTEM,
State Univ. of New York, Buffalo. Dept. of Civil Engineering.
D. D. Meredith.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY2, Proceedings paper No 11128, p 299-312, February, 1975. 4 fig, 5 tab, 14 ref.

Descriptors: *Multiple-purpose reservoirs, *Reservoir storage, *Water management(Applied), *Dynamic programming, Economics, Flow, Water allocation(Policy), Constraints, *Optimization, Hydraulics, Recreation, Irrigation water, Water supply, Decision making, Reservoir releases, Equations, Algorithms, Mathematical models, Systems analysis, *Operations.
Identifiers: *Multiple reservoir systems, *Operating policy, Benefit maximization.

The operation of multiple purpose reservoirs located on a river is a complex problem if the reservoirs are to be considered as an integrated system. The water in the system has multiple beneficial uses, such as water supply, irrigation, low flow augmentation, recreation, power generation, and navigation. Excess water in the system can result in reservoir overtopping or in flooding along a reach of the river. Presented is a method for determining the quantities of water to be stored in each reservoir, the flow between reservoirs, and the amount of water to be allocated to each beneficial use such that the total return from the system is maximized for a selected sequence of stream inflows. The method is a facility stage discrete differential dynamic programming approach for determining the optimal operating policy for a multiple purpose multiple reservoir system. The approach was developed to take advantage of the congruity between the time and distance dimensions of the problem. The stages in the dynamic programming formulation are defined to represent reservoirs and the state variables are defined to represent the amounts of release from reservoirs. The approach requires that the problem be formulated such that stages in the algorithm represent reservoirs rather than times at which decisions concerning releases must be made. The method is applied to an example problem consisting of three serially linked multiple purpose reservoirs; all of the five different initial trial release policies tried converged to within 2% of the optimum obtained previously by gradient projection and conjugate gradient techniques. PREDICTION OF DRAINAGE REQUIREMENTS -- BUYUK MENDERES RIVER BASIN, TURKEY,
California Univ., Davis. Dept. of Water Science and Engineering.
J. N. Luthin.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1092-1094, 1973. 6 fig, 3 ref.

Descriptors: *Drainage, *Irrigation, Projects, *River basins, *Irrigation water, Water table, Perched water, Artesian aquifers, Pressure, Hydraulic conductivity, Groundwater, Water quality, Leaching, Water costs, Farms, Management, Soils, *Forecasting.
Identifiers: *Buyuk Menderes River Basin(Turkey).

The prediction of the ultimate extent and development of drainage problems following the introduction of irrigation water in new areas is always difficult due to inadequate data available for such analysis. Although improved methods are needed, present predictions are based mostly on judgment related to experience with existing irrigation projects. Factors influencing the rate of development of the formation of drainage problems in the Buyuk Menderes River Basin of Turkey are outlined. Such factors are: (1) soil stratification causing perched water table conditions; (2) artesian conditions, including depth to artesian aquifer and magnitude of artesian pressure; and (3) hydraulic conductivity of various soil strata. The Menderes River Basin area is described, and soils, topography and shallow stratigraphy, the quality of applied irrigation water, on-farm management, and present groundwater conditions are discussed. Finally, present and future drainage problems in the Basin are briefly considered. It is expected that, in the flooded lower basin area, the rate of installation will lag behind the need for drainage construction for a number of years. A systematic way of analyzing the situation is needed since drainage problems can be a substantial portion of total project cost. Presently, a rational method for calculating the drainage requirement must be tempered by experience because of the difficulty of evaluating all of the factors affecting the development of the drainage problem. A METHOD FOR DETERMINING PEAK FLOWS AND DETENTION STORAGE REQUIREMENTS IN URBANIZING AREAS.
Soil Conservation Service, Indianapolis, Ind.
Indiana Technical Note Engineering-2, September 1973. 28 p, 8 fig, 4 tab, 1 ref. OWRR B-002-IND(7), and B-022-IND(3).

Descriptors: *Urban hydrology, *Urban runoff, *Urbanization, *Storage requirements, *Design flow, Storm runoff, Storage, Detention reservoirs, Hydrographs, Design flood, Statistical methods, Soil types, Rainfall-runoff relationships, Regression analysis, Indiana, Peak discharge, Small watersheds.
Identifiers: Instantaneous hydrographs.

A method was provided for computing the instantaneous peak flows for differing degrees of urbanization and runoff values for drainage areas between 10 and 600 acres. Relationships between runoff amounts, degrees of urbanization, reservoir release rates, and detention storage were presented. It was shown that the above relationships can be used to generate a complete unit hydrograph. The detention storage requirement was shown to be a function of the inflow hydrograph and the release rate of the detention structure. Factors for converting maximum release rates to normal release rates were presented for single stage pipe drop, orifice control, and weir drop spillway structures. (Terstriep-ISWS)

SPECIAL FLOOD HAZARD INFORMATION: CYPRESS CREEK, HARRIS COUNTY, TEXAS.
Army Engineer District, Galveston, Tex.
Prepared for Harris Soil and Water Conservation District, Houston, Texas, June 1972. 17 p, 1 fig, 4 tab, 10 plates.

Descriptors: Floods, *Flood control, *Flood protection, *Flood plains, *Flood plain zoning, *Texas, Flooding, Flood profiles, Flood frequency, Flood plain insurance.
Identifiers: *Cypress Creek(Tex), Harris County(Tex), Intermediate Regional Flood, Standard Project Flood, Flood prone areas.

Cypress Creek has a long history as a source of major floods in the Houston Metropolitan area. Sloping at 2.5 feet per mile, the stream bed adjoins flood plain of prairie land used for rice production and pasture in upper reaches and heavily wooded land undergoing residential and commercial development in lower reaches. Backwater from Lake Houston affects water surface elevation as well as flooding from intense local thunderstorms of short duration, rainstorms extending over periods of several days, or tropical storms with torrential rainfall. Long flood duration is caused by flat slopes and small channel capacities. Since the watersheds of Cypress Creek and adjacent Buffalo Bayou overlap giving an inaccurate account of Cypress Creek flood discharges, known data from coastal streams in the general geographical region and U. S. Weather Bureau data were used to compute larger flood discharges. Estimates for peak discharges of an Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) were made at 34,420 cfs and 51,310 cfs, respectively. Areas that would be inundated by a 50-year flood, by an IRF and SPF are shown on plates. Possible solutions to bring about most feasible and economic land use of flood plain include regulatory ordinances, subdivision regulations, building codes and zoning ordinances, especially flood plain zoning. Nonregulatory techniques are acquisition of flood plain lands for green belts and parks, acquisition of flood easements, flood proofing by site filling and structural adjustments, flood insurance to reduce high losses of flood victims who must continue as residents of flood prone areas, avoiding extension of public services into flood prone areas, urban renewal and temporary and permanent evacuation from flood plains. (Salzman-North Carolina)
W75-04742

SPECIAL FLOOD HAZARD INFORMATION: CLEAR CREEK, BRAZORIA, FORT BEND, GALVESTON AND HARRIS COUNTIES, TEXAS.
Army Engineer District, Galveston, Tex.
Prepared for Harris Soil and Water Conservation District, Houston, Texas, June 1972. 13 p, 1 fig, 15 plates.

Descriptors: Floods, Flooding, *Flood plain zoning, *Planning, *Flood control, *Flood protection, Flood plains, Dams, *Texas.
Identifiers: *Clear Creek(Tex), Harris County(Tex), Intermediate Regional Flood, Standard Project Flood, Brazoria County(Tex), Fort Bend County(Tex), Galveston County(Tex).

With a total drainage area of 250 square miles, Clear Creek Watershed is 45 miles long and varies from 2 to 13 miles in width, flowing in an easterly course through wooded and grass covered terrain into Clear Lake which flows into Galveston Bay in Houston SMSA. Watershed is subject to intense local thunderstorms of short duration, general storms extending over periods of several days and to torrential rainfalls associated with tropical storms. High flood peaks are furthered by the impervious clay soil conducive to rapid runoff. Although damaging floods occurred in the area of sparse development, no floods have been recorded since 1962 when intensive development on flood plain began. Intense urbanization of the Houston SMSA has intensified the potential for flood devastation. Residential areas like Clear Lake Shore, oil tank farms, commercial and industrial areas would be greatly damaged by an Intermediate Regional Flood (IRF) or a Standard Project Flood (SPF) which would peak 1 to 2 feet higher than an IRF. Regulatory methods to reduce flood damage include: floodway encroachment limits to be established through flood plain zoning, subdivision control ordinances restricting construction to levels above selected flood levels, and building codes that establish minimum first floor elevations and flood proofing of structures. Nonregulatory techniques involve purchase of lands for open spaces and/or flood easements, flood proofing by site filling and structural adjustments, temporary and permanent evacuation of people and structures from flood plains, posting of warning signs in high flood hazard areas, and nonextension of utilities and roads by the city into the flood zone. (Salzman-North Carolina)
W75-04743

FLOOD PLAIN INFORMATION: BLUE RIVER AND TRIBUTARIES, JOHNSON COUNTY, KANSAS.
Army Engineer District, Kansas City, Mo.
Prepared for the Johnson County Commissioners and the Kansas Water Resources Board, May 1970. 38 p, 12 fig, 5 tab, 23 plates.

Descriptors: Floods, Flooding, *Flood control, *Flood protection, *Flood plains, *Flood profiles, *Kansas.
Identifiers: *Blue River(Kan), Wolf Creek(Kan), Coffee Creek(Kan), Indian Creek(Kan), Tomahawk Creek(Kan), Brush Creek(Kan), Johnson County(Kan), Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

Several major streams, including Blue River, Wolf Creek, Coffee Creek, Indian Creek, Tomahawk Creek and Brush Creek compose the Blue River Basin with a total drainage area of 272 square miles. Characterized by rolling topography with steep slopes adjacent to larger streams, flood plains average 2000 to 4000 feet wide for Blue River and 1000 to 3000 feet wide for the creeks. The river bed slopes 4 feet per mile with channel varying from 50 to 70 feet wide and banks 10 to 20 feet high. Creeks have steeper slopes. Channels' widths and depths vary. Drainage patterns are well developed and no major impoundments exist. Except for intense development on Brush and Rock Creek flood plains, most of the area is rural, on the verge of total urbanization. Flood protection includes bridge improvements, channel enlargements and bank protection by stone and concrete walls. Floods generally rise rapidly and are of short duration. The greatest flood on Indian Creek was recorded on June 5, 1965 with a peak discharge of 5,250 cubic feet per second. An Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) would cause extensive damage to the flood plain cresting at 14,900 cfs and 22,000 cfs respectively. A SPF would rise to its peak in about 12 hours on the average, remaining out of banks one to three days. Flood depths for various locations in Johnson County can be made by referring to plates included. (Salzman-North Carolina)
W75-04744

FLOOD PLAIN INFORMATION: NORTH FORK RIVANNA RIVER, ALBEMARLE COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va.
Prepared for the Albemarle County Board of Supervisors, March, 1973. 30 p, 5 fig, 11 tab, 15 plates.

Descriptors: Floods, *Flooding, *Flood control, *Flood protection, *Flood plain, *Virginia.
Identifiers: North Fork Rivanna River(Va), *Rivanna River(Va), Albemarle County(Va).

Located in the west central part of the county, North Fork Rivanna River receives run-off from about 176 square miles before merging with South Fork Rivanna River to form the Rivanna River, which flows for 31 miles southwardly falling about 3 feet per mile. The flood plain remains largely undeveloped being mostly pastures and woodlands. Several gaging stations on the Rivanna River supplemented by newspapers, historical documents and interviews provided data. Floods occur during all seasons resulting from intense rainfall often associated with tropical storms. The duration of flooding depends on duration of run-off producing rainfall; floods may last several days. No flood damage reduction measures exist although several are currently being studied as a part of the Corps' investigation of the entire James River Basin. The largest and most damaging flood occurred in October 1942 with intense rainfall from a hurricane lasting for 3 days. An Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) would inundate the flood plain with peak discharges of 36,000 cubic feet per second (cfs) and 63,000 cfs respectively. During an IRF flood water depths may range between 30 and 40 feet in the main channel while overbank depths may average about 18 feet. Substantial damage would occur with the main channel having a possible velocity of 9 feet per second causing severe erosion. Overbank flow might reach 4 feet per second. Duration above bankfull may be as much as 31 hours for an IRF. (Salzman-North Carolina)
W75-04745

FLOOD PLAIN INFORMATION: REPORT ON THE DES PLAINES RIVER, ILLINOIS AND WISCONSIN.
Army Engineer District, Chicago, Ill.
Prepared for Northeastern Illinois Metropolitan Area Planning Commission and Southeastern Wisconsin Regional Planning Commission. March, 1966. 36 p, 20 photo, 4 tab, 18 plates, 19 ref, append.

Descriptors: Floods, Flooding, *Flood data, *Flood forecasting, *Flood plains, *Illinois, *Wisconsin, Flood control, Flow characteristics, Flood frequency, Flood recurrence interval, Maximum Probable Flood, Flood damage, Flood water.
Identifiers: *Des Plaines River(Ill-Wis), Des Plaines(Ill), Standard Project Flood(SPF), Greater Probable Flood.

Flooding of the main stem of the Des Plaines River from Riverside, Illinois to the headwaters in Racine County, Wisconsin was investigated. The Des Plaines flood plain encompasses 14,200 acres: 8,100 acres in Illinois and 6,100 acres in Wisconsin. Damage has been limited in Illinois counties by the use of flood plains as open space. In Cook County, Illinois, forest preserves cover 80% of the flood plain and in Lake County, Illinois, only 4% of the flood plain is occupied by housing. Flooding has occurred in February through April due to thawing, and damage has increased due to increased development. The major flood of record was measured in 1938 with a discharge of 5,500 cubic feet per second at Des Plaines and stage levels approached the 635.3 feet record on seven other occasions. The Greater Probable Flood (Intermediate Flood on study maps) is predicted to have a recurrence of 10 years and a discharge of 7000 cubic feet/second whereas the Standard Project Flood would have a 34,500 cubic feet/second discharge. Comparable data for other areas are given. Proposals for reducing flood damage include control of land use in the flood plain in both Illinois and Wisconsin, dredging, widening, and straightening of the channel, levee construction, reservoirs, and watershed treatment measures. (Park-North Carolina)
W75-04746

FLOOD PLAIN INFORMATION -- WILLIAMSON CREEK, AUSTIN, TEXAS.
Army Engineer District, Galveston, Tex.

Prepared for City of Austin, Texas. p 37, June, 1973. 5 tab, 6 fig, 14 plates, glossary.

Descriptors: *Flood control, *Flood damage, *Maximum probable flood, *Non-structural alternatives, Flood discharge, Flood flow, Flood peak, Flood plain zoning, Flood protection, Flooding, Floods, Erosion, Flash flood, *Texas.
Identifiers: *Flood plain management, *Williamson Creek(Tex), Austin(Tex), Standard Project Flood, Intermediate Regional Flood.

Williamson Creek, a major tributary of Onion Creek, passes Oak Hill and Pleasant Hill, Texas, just southwest of Austin. Recently six miles of Williamson Creek and its flood plain were incorporated into rapidly expanding Austin. Subdivision development is encroaching on its flood plain. Newspaper records, interviews, and studies of nearby streams indicate the Creek is subject to flash flooding -- floods of short duration with very sharp crests. A relatively steep topography funnels the region's intense spring and fall rains (up to 19.03 inches in 24 hours, recorded - 1921) and, though the resulting floods are not widespread, they have high velocities and are very destructive to all improvements in the flood path. In 1971 the Austin City Council resolved to work on flood plain management and has passed two ordinances requiring conformity to a Master Drainage Plan and initiating flood plain development criteria. This report serves as a basis for further action and encourages zoning, subdivision regulations, and an end to government encouragement of flood plain development. Data on statistically probable severe floods can be used to delineate protected areas. A Standard Project Flood would flow at 8.2 feet per second in the channel, 3.1 feet per second overbank, with a peak discharge of 31,700 cfs. Cross sections and maps are provided. (Herr-North Carolina)
W75-04747

FLOOD PLAIN INFORMATION - CEDAR BAYOU, HOUSTON METROPOLITAN AREA, TEXAS.
Army Engineer District, Galveston, Tex.
Prepared for Harris Soil and Water Conservation District, Houston, Texas, and Texas Water Development Board, Austin, Texas. June, 1972. 27 p, 6 tab, 4 fig, 28 plates, glossary.

Descriptors: *Flood forecasting, *Flood control, *Non-structural alternatives, *Surges, Floods, *Floods profiles, Peak discharge, River forecasting, Floodproofing, Flood plains, Flood data, Texas.
Identifiers: *Hurricane tidal flooding, *Cedar Bayou(Tex), Intermediate Regional Flood, Standard Project Flood, Intermediate Regional Hurricane, Stand Project Hurricane, Houston SMSA(Tex).

Baytown, Texas, extends 11 miles up the west bank of Cedar Bayou from its mouth at Galveston Bay. Cedar Bayou meanders through relatively flat forest and agricultural land but is heavily developed along its lower reaches, and unprecedented growth of this area 30 miles east of Houston is causing increased urbanization along and in the bayou's flood plain. Cedar Bayou is subject to intense rain storms and thunderstorms as well as tropical hurricanes. Its relatively flat slopes and small channel capacity produce widespread flooding which lasts for days. In 1951 Harris, Liberty, and Chambers Counties jointly contracted to widen, deepen, and partially straighten the channel, but serious flooding continues with considerable property damage. A maximum probable flood (Standard Project Flood) combined with hurricane tidal flooding in the lower 10-mile reach would produce a surge level of 18.0 feet at river mile 10 (in a Standard Project Hurricane). Maximum discharge would be 33.300 cfs with an overbank velocity of 1.2 feet per second, which would deposit considerable amounts of debris. Nonstructural alternatives ot lessen flood damage, include zoning, subdivision regulations, building codes, flood proofing of structures already built, and development policies. (Herr-North Carolina)
W75-04748

FLOOD PLAIN INFORMATION: BIG CREEK, CHETOLAH CREEK AND LINCOLN DRAW, HAYS, KANSAS.
Army Engineer District, Kansas City, Mo.
Prepared for the City of Hays, Kansas and the Kansas Water Resources Board, p 36, June 1969, 12 fig, 5 tab, 10 plates.

Descriptors: Floods, Flooding, *Flood plains, *Flood control, *Flood protection, Dams, Levees, *Kansas, Velocity conduits, Storm runoff, Conduits.
Identifiers: *Big Creek(Kan), *Chetolah Creek(Kan), *Lincoln Draw(Kan), Hays(Kan), Intermediate Regional Flood, Standard Project Flood.

Big Creek, a tributary of Smoky Hill River, and its tributaries, Lincoln Draw and Chetolah Creek pass through Hays covering 13.4 stream miles in the study area. Although much of Hays is on high ground, the flood plain contains much development. Floods are of rapid rise and short duration. Flood damage prevention measures on Big Creek include channel improvements and a levee system which tends to raise the water surface elevations behind it creating a backwater effect thereby reducing effective capacity of the levied channel. A low water dam and sewerage plant do not influence the flood situation. Lincoln Draw's drainage is affected by limited carrying capacity of conduits and a detention dam which overflows in periods of heavy rain. Trees growing in the channel also impede Lincoln Draw's flood flow. Chetolah Creek's flood plain is largely agricultural except for an Interstate Highway which detains flows. The Channel has been realigned and cleared and no damaging flood has been experienced since the flood plain has been under development. The greatest flood on Big Creek occurred June 17, 1957 with a peak discharge of 22,400 cubic feet per second. An Intermediate Regional Flood (IRF) would have peak discharges of slightly larger than the flood of June 1957. A Standard Project Flood on Big Creek would discharge 51,500 cfs, greatly exceed capacity of the levees and inundate an area much larger than that affected by an IRF. Velocities generated by all major floods will be dangerous. Overflow areas, depths of flow and contours of flooded areas can be determined from plates included in report. (Salzman-North Carolina)
W75-04749

FLOOD PLAIN INFORMATION -- GOOSE CREEK, BAYTOWN, TEXAS.
Army Engineer District, Galveston, Tex.
Prepared for: The City of Baytown, Texas. p 39, September 1973. 6 tab, 6 fig, 11 plates.

Descriptors: *Flooding, *Maximum Probable Flood, *Peak discharge, *Floods, Floodways, Flood control, Flood data, Flood discharge, Flood profiles, *Texas.
Identifiers: Intermediate Regional Flood, Standard Project Flood, Intermediate Regional Hurricane, Standard Project Hurricane, *Baytown(Tex), Goose Creek(Tex).

Baytown, Texas, located along the Houston Ship Channel where it flows into Galveston Bay 30 miles downstream from Houston, is the center of one of the world's largest oil producing areas. Goose Creek flows from north to south through Baytown into the bay. Like other Texas coastal streams, it drains low flat land; maximum relief in its 30.5 square mile basin is 43 feet above mean sea level. With the growth of Baytown due to expanding oil refineries there has been rapid encroachment on the Goose Creek flood plain. Stream gaging records from similar nearby coastal streams as well as newspaper records show that there have been 20 damaging floods in the area from 1854 to 1973 caused by severe thunderstorms or associated with tropical hurricanes, usually lasting up to two days. Baytown's 1971 flood plain ordinance is included. The city limits construction to land above the 100-year flood level and only allows properly floodproofed nonresidential structures on the flood plain. Swelled by 13 inches of rain in June, 1973, Goose Creek rose between 2 and 3 feet over its banks, destroyed Goose Creek Bridge, and did considerable damage. The computed Intermediate Regional Flood would be slightly higher. A Standard Project Flood would crest at 5.0 feet. In the lowest 5 miles of the river a Standard Project Hurricane would raise the level 19.0 feet driving water into the river from the bay. (Herr-North Carolina)
W75-04750

FLOOD PLAIN INFORMATION: SHUNGANUNGA CREEK, TOPEKA, KANSAS.
Army Engineer District, Kansas City, Mo.
Prepared for the City of Topeka, Kansas and the Kansas Water Resources Board, December 1968. 25 p, 10 fig, 6 tab, 13 plates.

Descriptors: Floods, Flooding, *Flood control, *Flood protection, *Flood profiles, *Levees, Flood plain, Dams, *Kansas, Flood flow, Velocity.
Identifiers: *Shunganunga Creek(Kan.), Topeka(Kan), Intermediate Regional Flood, Standard Project Flood.

Shunganunga Creek, a right bank tributary of the Kansas River, and its tributaries comprise the primary drainage system for the southern portion of Topeka. Development in the flood plain consists of commercial and residential structures. The stream basin has a length of 14 miles and width of 7 miles with 22.5 square miles of drainage area in this study. Topography ranges from hilly in upper reaches to flat in the lower reaches sloping at about 7.15 feet per mile. Main flooding season occurs during the summer months resulting from general heavy rain. Floods are characterized by rapid rise, high velocity and a quick return to bankfull level. Obstructions to flood flow consist of 29 bridges. Flood protection includes widening of channel, construction of a left bank levee, replacement of bridges and two detention dams. Greatest known flood occurred on April, 1945 when the Kansas River was at a high stage with a peak discharge of 8,800 cfs. Severe flooding also occurred in 1951, 1957, 1964, 1965, and 1967. An Intermediate Regional Flood (IRF) discharge would be equal to the April 1945 flood. A Standard Project Flood would be three times as great as the IRF with channel velocity reaching 15 feet per second or a little more than 10 miles per hour. Profiles of Shunganunga Creek and its tributaries are provided on plates. (Salzman-North Carolina)
W75-04751

FLOOD PLAIN INFORMATION: MECHUNK CREEK, ALBEMARLE COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va.
Prepared for the Albemarle County Board of Supervisors, November, 1973. 22 p, 12 fig, 5 tab, 12 plates.

Descriptors: *Floods, *Flooding, Flood control, Flood protection, *Flood plains, *Virginia, Flood damage, Flood profiles.
Identifiers: *Mechunk Creek(Va), Rivanna River(Va), Albemarle County(Va).

Mechunk Creek flows south from its headwaters in the Southwestern Mountains in Albemarle County and empties into the Rivanna River near Union Mills in Fluvanna County. The study covers approximately 6.5 miles of the creek which slopes at 11.4 feet per mile. The main channel which is mostly free from vegetation varies from 40 to 50 feet in the lower reach to 20 to 30 feet in the upper

ach. Adjacent flood plains vary from open farm nd to heavy forest. Several small earthfill dams ı tributaries have no flood control capacity. Five the seven bridges which cross the creek would e overtopped by an Intermediate Regional Flood RF). There are no stream gaging stations there- re data were provided from nearby streams. oods occur during all seasons resulting from hur- canes or intense rainfall. Concentration of flood- ater can occur within 12 hours after beginning of noff creating extreme flood heights in a short ne. Duration of flooding depends on duration of n-off producing rainfall usually lasting several ys. No flood damage reduction measures exist. ajor flooding occurred in April 1937 and October 42. The most recent flood was in June 1972 used by tropical storm 'Agnes' with damage in bemarle County estimated at $3.8 million. An F and Standard Project Flood would inundate rmland and bridges with peak discharges of ,500 cubic feet per second (cfs), and 42,900 cfs. alzman-North Carolina)

OOD PLAIN INFORMATION--COASTAL OODING, CITY OF CHESAPEAKE, VIR- NIA.
my Engineer District, Norfolk, Va.
epared for the City of Chesapeake, Virginia. cember, 1972. 38 p, 3 tab, 6 fig, 30 plates, glos- y.

scriptors: *Flood control, Tidal waters, *Flood ves, *Surges, *Flood damage, Flood profiles, acuation, Flood frequency, Flood peak, Flood otection, Historic floods, Hurricanes, *Virginia, ooding.
ntifiers: Standard Project Tidal Flood, Inter- diate Regional Tidal Flood, *Chesapeake(Va), zabeth River(Va), Hampton Roads(Va), rthwest River(Va).

e City of Chesapeake, Virginia, covers 353 are miles and is very flat with an average eleva- ı of only 12 feet. It contains three branches of Elizabeth River and tidal estuaries of Hampton ads and the Chesapeake Bay in the north. In the theastern part of the city is the Northwest er and the Albemarle and Chesapeake Canal. se bodies of water are subject to tidal flooding the heavy residential, industrial, and commer- development on the flood plains. Gage records the Elizabeth River, as well as newspaper ac- nts, show that flooding comes in the spring ı northeast storms, and from May to vember with tropical hurricanes. There are no ulations of land use on the flood plain in spite requent flooding. In August, 1933, the deepest od on record reached depths up to 13 feet, mean level. As recently as 1962 tidal flooding accom- ying a northeast storm reached 7.4 feet and ed several days. An Intermediate Regional al Flood would be about a foot deeper than the 3 flood. The maximum probable flood, a Stan- d Project Tidal Flood, would reach 13.0 feet, se much damage, and isolate many areas caus- extreme hazards. Data in this report will help in nulating evacuation plans and show areas ch require flood plain management legislation. nplete structural protection is dismissed as un- istic. (Herr-North Carolina)

OOD PLAIN INFORMATION: (PATUXENT ER) WESTERN BRANCH (FOLLY, LOTT- RD AND VALD HILL BR.), PRINCE ORGES COUNTY, MARYLAND.
y Engineer District, Baltimore, Md.
pared for the Maryland-National Capital Park Planning Commission. December, 1972. 33 p, , 14 plates, 10 tab.

criptors: *Floods, *Flooding, *Flood data, od forecasting, *Flood plains, *Flow charac- tics, *Maryland, Flood control, Flood uency, Flood recurrence interval, Maximum able Flood, Flood damage, Flood water.

Identifiers: *Patuxent River(Md), Prince Georges County(Md), Intermediate Regional Flood(IRF), Standard Project Flood(SPF), Bald Hill Branch(Md), Folly Branch(Md), Lottsford Branch(Md).

The Western Branch of the Patuxent River includes three tributaries: Bald Hill Branch, Folly Branch, and Lottsford Branch. The area is substantially developed and has projected further development. Continuous records of river stage and discharge 11.2 miles upstream from the mouth have been maintained by the U.S. Geological Survey. The largest known flood occurred in August, 1955 with five others of approximately the same elevation, 8.51 stage feet, occurring between 1952 and 1972. The Intermediate Regional Flood (IRF), 100 year occurrence, has a projected stage elevation of four feet higher on Western Branch than the 1955 flood while the Standard Project Flood(SPF) would average five feet higher than the IRF. Peak discharge would be 14,000 cubic feet per second at the mouth of Western Branch for an IRF compared to 33,700 cfs at the mouth of Western Branch, assuming a total rainfall of 14.2 inches in 96 hours, for a SPF. The long duration of flood and the high velocity of flow which might reach a maximum of 7-10 feet per second in the channel for an IRF could cause extensive damage in the heavily developed areas, with the 21 bridges across the Western Branch and the three tributaries which accumulate high water causing safety hazards. This report is intended as basis for future study for the highly urbanized south-central area of Maryland bordering Washington, D.C. (Park-North Carolina)

4B. Groundwater Management

THE RISING WATER TABLE IN THE WEST NUBARYA AREA OF EGYPT,
International Inst. for Land Reclamation and Improvement, Wageningen (Netherlands).
F. E. Schulze, and N. A. de Ridder.
Nature and Resources, Vol 10, No 1, January-March 1974, p 12-18, 2 fig, 1 ref.

Descriptors: *Water table, *Subsurface investigations, *Surface drainage, *Groundwater, *Seepage, Soil surveys, Pumping, Systems analysis, Irrigation, Crop production, Aquifers.
Identifiers: *Egypt.

Problems of the rising water table and accompanying salinity phenomena were studied in the Project area for the purpose of establishing a program to be carried out by the Egyptian Ministry of Reclamation. A number of subsystems with the West Nubarya area system can be isolated to study, some of which can be controlled to an extent, while others are beyond effective control. These include the climatological subsystem, the agricultural production subsystem, the groundwater subsystem, the surface-water distribution subsystem, and the artificial drainage subsystem. Some components of the recommended program requiring investigation are the groundwater characteristics of the area, including subsurface geology and hydraulic properties of aquifers and confining layers; surface water hydrology, including inflow, outflow, and seepage; consumptive uses and deep percolation losses using lysimeter measurements; and water application techniques on a practical scale to be conducted in conjunction with consumptive use and deep percolation loss investigations. Descriptors: *Groundwater, Surface waters, *Pumping, *Illinois, Sand aquifers, *Aquifers, Gravels, Sandstones, Dolomite, Water users, Water utilization, Groundwater resources, *Water supply, Conjunctive use.

Large supplies of groundwater are developed from three aquifer systems in northern Illinois for public, industrial, and domestic uses. Sand and gravel and shallow dolomite aquifers are generally encountered at depths less than 500 feet; the depth of sandstone aquifers generally exceeds 500 feet. Pumpage increased from 303.08 mgd in 1960 to 424.30 mgd in 1970. Of the total 1970 pumpage, 61% was for public supplies, serving 274 municipalities, 248 subdivisions, and 308 institutions; 971 industries pumped 25% of the total pumpage. Cook County pumped considerably more groundwater than any other county, nearly 24% of the 1970 total. Other major withdrawals of groundwater are in Du Page, Kane, Will, and Winnebago Counties. In addition to groundwater pumpage, 1112.25 mgd was pumped from Lake Michigan for public supplies in 1970. An additional 29.42 mgd surface water pumpage for public suplies was pumped from the Kankakee, Mississippi, and Vermilion Rivers. Data were provided for planning growth of groundwater pumpage in this area. (Dawes-ISWS)

4C. Effects On Water Of Man's Non-Water Activities

CORRELATION OF HYDROLOGIC MODEL PARAMETERS WITH CHANGING LAND USE AS DETERMINED FROM AERIAL PHOTOGRAPHS,
Clemson Univ., S. C. Dept. of AGgricultural Engineering.
J. T. Ligon, and D. B. Stafford.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 407, $4.75 paper copy, $2.25 microfiche. South Carolina Water Resources Research Institute, Clemson, Report No 50, December 1974. 75 p, 16 fig, 10 tab, 9 ref, 2 append. OWRT A-024-SC (5).

Descriptors: *Land use, *Urbanization, Hydrology, *Simulation analysis, *Streamflow, Aerial photography, *South Carolina, *Model studies, Computer programs, Watersheds(basins), Watershed management.
Identifiers: *Reedy River(SC), *North Tyger River(SC), Piedmont region(SC), Stanford watershed model.

Results are described of a research project in which the effects of progressive land use changes in watersheds on the hydrologic response of the water sheds were investigated. The study examined two watersheds in the Piedmont Region of South Carolina. The North Tyger River near Spartanburg was selected for study because it was believed to be typical of watersheds which have experienced significant changes in agricultural land use practices. The Reedy River near Greenville was selected as being typical of watersheds in which rural land is being converted rapidly to urban land use. The distribution of land use in each watershed was determined at six intervals over the past 30 years from measurements on aerial photographs. A computer program for the Kentucky version of the Stanford Watershed Model was used to simulate streamflow in the two watersheds. A comparison of simulated and recorded streamflow was used to optimize model parameters so that reasonable agreement between simulated and recorded streamflow was obtained. Correlation of the optimized model parameters and watershed land use was the technique used to examine the relationship between watershed hydrologic response and land use changes. The watershed model parameter, basic maximum infiltration rate, was found to increase significantly with the percentage of the watershed in forest and pasture and to decrease significantly with the percentage of the watershed which consisted of impervious area and residential area. The other three watershed model parameters studied were not significantly correlated with watershed land use.

AN ANALYSIS OF FOREST WATER PROBLEMS IN GEORGIA,
Georgia Univ., Athens. School of Forest Resources.
J. D. Hewlett.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 350, $3.75 in paper copy, $2.25 in microfiche. Georgia Forest Research Council Report No 30, August 1972. 27 p, 4 fig, 2 tab, append. OWRT A 022-GA(1).

Descriptors: *Water resources, *Forests, *Georgia, Hydrology, Forest management, Watershed management.
Identifiers: *Forest hydrology.

The influences of the forests of Georgia on water flows, erosion and flooding are discussed. The impact of man's various management activities on soil and water resources begins in this complex segment of the hydrologic cycle. The water resources of the State are summarized in terms of the adequacy or inadequacy of the supply or availability by the six major geologic provinces. The overall pattern shows that the Lower Coastal Plain is abundantly endowed with water and water-related resources, while the Ridge and Valley region is in rather short supply. The forest may be used largely to moderate the ecological and hydrological impacts of continued urbanization and industrialization of the Piedmont, and its role in this respect may eventually exceed that of timber supply. Forestry has a greater stake in the Lower Coastal Plain than in any other part of Georgia. About 30% of the total, or 1.5 million acres, is in bays, swamps, ponds, and marshes which the forest managers believe could be greatly improved for timber production by surface drainage. Beach erosion by wind and wave on the outer islands is serious enough to warrant attention from foresters. In developing the multiple use of forest, hydrologic research and trained foresters watershed managers will play a key role. (See also W75-04357 and W75-04358) (Knapp-USGS)

STUDY OF SUBSURFACE FLOW INTO MOUNTAIN STREAMS AS RELATED TO TOPOGRAPHY AND PARTIAL (VARIABLE) SOURCE AREAS,
Georgia Univ., Athens. School of Forest Resources.
J. D. Hewlett.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 351, $3.25 in paper copy, $2.25 in microfiche. Termination Report, December 1972. 5 p, 4 ref. OWRT A-022-GA(1).

Descriptors: Hydrology, *Small watersheds, Base flow, Hydrographs, Groundwater, *Storm runoff, *Demonstration watersheds, *Water sources, *Model studies, Watersheds(Basin).

Results are summarized of a series of studies designed to model the mechanism by which rainfall and snowmelt become streamflow in headwater areas, particularly on forests, ranges and wildlands. The study was intended to further develop the concept of a variable source area of streamflow and a model. The report describes the contributions of the research to the IHD program and cites scientific publications resulting from the research. (See also W75-04356 and W75-04358)

THE VARYING SOURCE AREA OF STREAMFLOW FROM UPLAND BASINS,
Georgia Univ., Athens. School of Forest Resources.
J. D. Hewlett, and W. L. Nutter.
Available from the American Society of Civil Engineering, 345 E. 47th Street, New York, NY, $6.00 in paper copy, $2.25 in microfiche. In: Proceedings of the Symposium on Interdisciplinary Aspects of Watershed Management, Montana State University, Bozeman, Montana, August 3-6, 1970, p 65-83. 10 fig, 14 ref. OWRT A-022-GA(1).

Descriptors: *Subsurface runoff, Overland flow, Small watersheds, Base flow, Groundwater, Water sources, *Demonstration watersheds, Model studies, *Storm runoff, Watersheds(Basins).

To counteract continued insistence by some hydrologists that subsurface stormflow cannot contribute substantially to the storm hydrographs, the variable source area concept is reviewed and hydrograph data from various parts of the world are assembled to prove that subsurface stormflow is both a general and a major hydrologic phenomenon. In addition, subsurface stormflow hydrographs from a large (200 x 8 x 4 feet) watershed segment model are explained in relation to actual watershed discharge under the same storm rainfall. A conceptual model for the first order stream hydrograph is proposed to define hydrologic terms and to serve as a physically valid core model for hydrograph simulation programs. The conceptual model is not yet operational. (See also W75-04356 and W75-04357.)

REGULATION OF URBAN DEVELOPMENT TO CONTROL RUNOFF AND EROSION,
Pennsylvania Univ., Philadelphia. Inst. for Environmental Studies.
I. L. Strong.
July, 1972, revised September, 1972. 26 p, 1 fig.

Descriptors: *Delaware River Basin Commission, Legal aspects, *Erosion control, *Local governments, *Watershed management, *Water management(Applied), Planning, Water pollution control, Water law, *Regulation, Delaware, New York New Jersey, Pennsylvania, Water zoning, Water sources, Institutional constraints, Government, Law enforcement, Management, Constraints, Permits, Water permits, Public rights, Public access, River regulation, Flood plain zoning, *Runoff, Runoff forecasting, *City planning, *Urbanization, Surface-groundwater relationships.

Identifiers: Runoff and erosion control ordinances, *Ordinances, Subdivision regulations.

Since relationships between development and increased runoff are known, it is possible to design permanent runoff management programs to control the rate and amount of runoff discharged into streams. Through adequate planning prior to development and effective enforcement programs during and after development, public costs from erosion, sedimentation, and flooding can be averted. A runoff and erosion control ordinance is proposed for use in the Tri-County region of Delaware River basin, and it should be incorporated by local governments as an amendment to subdivision ordinances or as an independent ordinance. The Delaware River Basin Commission (DRBC) reviews projects whose effects are on water resources, so almost all local subdivision projects are outside of the Commission's review power. This proposed ordinance stipulates permits, inspection, protection of adjacent properties, maintenance of runoff and erosion control measures, penalties, exemptions, and other general provisions. The ordinance states objectives and established procedures for enforcement, but leaves detailed specifications for protection measures to the Soil and Water Conservation Districts. It therefore should serve as a starting point for local governments when developing an ordinance appropriate for their needs and circumstances. (Grden-North Carolina)
W75-04362

DIFFERENCES BETWEEN PLANNED AND ACTUAL COSTS AND BENEFITS IN SMALL WATERSHED DEVELOPMENT,
Economic Research Service, East Lansing, Mich. Natural Resource Economics Div.
J. D. Sutton.
Soil and Water Conservation, Vol 29, No 4, p 165-168, July/August, 1974. 4 tab, 4 ref.

Descriptors: *Small watersheds, *Water resources development, *Watershed management, *Projects planning, Environmental effects, Cost-benefit analysis, Cost-benefit ratio, River basin development, *Costs, *Benefits.

Water resource planners design projects on the basis of future benefits; the discounted future benefits must exceed the economic costs. The difficulty in planning is that many of the costs and benefits do not become apparent until several years after planning, therefore the variables that relate to the costs and benefits must be projected. Evaluations of projects several years after they have been in operation allow an analysis of the planning process and supplies a way to perfect future planning. Four completed small watershed projects that had operated for four to five years were evaluated by qualitatively comparing current values of primary costs and benefits with planners' estimates and identifying reasons for devergences between planned and achieved values. The results indicated that planners should encourage local involvement in planning; analyze socioeconomic trends at the project and river basin levels; and, use a multiobjective planning approach to reduce the difference between the planned estimates and the actual values. The projects were largely considered to have no effect on the environment. Beauty of the area involved was most often considered improved. In areas where the natural streams were channeled negative responses were received for the effects on hunting, fishing, and wildlife cover. (Orr-FIRL)

5A. Identification Of Pollutants

IDENTIFICATION AND EVALUATION OF WATER TRACERS AMENABLE TO POST-SAMPLING NEUTRON ACTIVATION ANALYSIS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. A. Jester, and K. A. Uhler.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 348, $4.75 in paper copy, $2.25 in microfiche. Research Publication Number 85, September 1974. 92 p, 16 fig, 5 tab, 10 ref, 2 append. OWRT A-026-PA(4).

Descriptors: *Neutron activation analysis, *Analytical techniques, *Chemical analysis, *Acidic waters, Hydrogen ion concentration, Ions, *Pollutant identification, Halogens, Chlorine, Iodides, Cobalt, Bromides, *Tracers.
Identifiers: *Tracer techniques, Short irradiation, Vanadium, Cobaltous ions, Chlorine ions, Iodide ions, Bromide ions.

The halogen ions Br-, I-, and Cl- appear to be suitable water tracers for use in waters having a pH range between pH 5 and pH 8 with neutron activation analysis. The bromide and iodide ions can experience very great dilutions and still be detected above normal background concentrations. Chlorides are limited because of the normally substantial natural backgrounds which, in the 27 samples analyzed, range from 1.3 mg/l to 62 mg/l. When using several tracers in one program the chlorides should be injected closest to the sampling point because of the dilution factor limitation. Sensitivities and detection limits are variable and depend upon background concentrations and maximum allowable tracer concentrations. In very acid waters the vanadium and cobaltous ions appear to offer promise, with the divalent cation of vanadium offering the greater sensitivity of the two. Bromides and chlorides appear to be reliable in this pH range with the same limits of detection as at more neutral pH values. Successful application of these tracer techniques is strongly dependent on analysis of the carrier water to determine background concentrations of the tracers. These analyses must be made using activation analysis, since wet chemical analyses do not provide sufficient sensitivity. (Sink-Penn State)

SUPERSONIC AIRCRAFT AND THE OZONE LAYER,
California Univ., Berkeley. Lawrence Berkeley Lab.
H. S. Johnston.
Available from NTIS, Springfield, Va 22161 as Rept. No. LBL-2748, $5.45 in paper copy, $2.25 in microfiche. Report No. LBL-2478, May 1974. 52 p, 15 fig, 3 tab, 29 ref. AEC W-7405-ENG-48.

Descriptors: *Ozone, *Oxygen, *Nitrogen, Movement, Nitrogen compounds, Oxides, Aircraft, Solar radiation, *Model studies, *Air pollution, *Pollutant identification, Path of pollutants, Air pollution effects, Atmosphere.
Identifiers: *Photochemistry, *Stratosphere.

Model calculations including atmospheric motions and the photochemistry of oxygen, water, and

nitrogen oxides indicate that 500 supersonic transports would reduce the stratospheric ozone shield between 3 and 30 percent. Stratospheric ozone has been observed to change with solar-cycle modulated cosmic rays, presumably by virtue of the nitric oxide produced. The ozone data of 1960-70 are consistent with a small decrease and then increase of ozone associated with nitric oxide from nuclear-bomb tests. These observed changes of ozone with nitric oxide indicate a greater sensitivity of stratospheric ozone to nitric oxide than is given by most model calculations. (Houser-ORNL)

METHOD FOR THE CONSTRUCTION OF THREE-DIMENSIONAL ELECTRON MICROGRAPHS,
California Univ., Livermore. Lawrence Livermore Lab.
R. J. Grabske.
Available from NTIS, Springfield, Va 22161 as No. UCRL-51611, $4.00 in paper copy, $2.25 in microfiche. Report No. UCRL-51611, Sept. 10, 1964. 6 p, 3 fig, 1 ref.

Descriptors: Digital computers, Research and development, Dimensions, Shape, Size, Photography, Molds, Plastics, Polymers, Heat, *Pollutant identification, *Instrumentation, Measurement, Fabrication, *Electron microscopy.
Identifiers: *Micrographs(Three dimensional).

A method is described for the construction of three-dimensional pictures from the computer output of the polytropic montage process for three-dimensional representation in electron microscopy. The final computer output is a series of two-dimensional images on photographic film, each of which corresponds to one increment in the third dimension. These film positives (dark images on light background) are stacked alternately with U-shaped spacer bars, with aluminum backing plates top and bottom. The entire assembly is bolted together firmly to form a mold. The mold is subsequently filled with a transparent plastic monomer and polymerized by heat. (Houser-ORNL)

Descriptors: *Research and Development, *Air pollution, *Control, *Model studies, Management, Bays, Operations, Census, *California, Path of pollutants, Pollutant identification.
Identifiers: *San Francisco Bay, Photochemistry.

An interagency effort is underway at the University of California Lawrence Livermore Laboratory (LLL), the NASA-Ames Research Center (ARC) and the Bay Area Air Pollution Control District (BAAPCD) to develop and validate a regional air pollution model which can be applied to the air quality problems facing the San Francisco Bay Area. Previous Semi-annual Reports (UCID-16301, July 9, 1973; UCRL-51537, February 27, 1974) reported on the organization of the development project, progress made, and plans for the remaining time. The planned research activities were divided into five major subtasks, and a joint working group was established for each -- Operational Planning, Source Inventory, Photochemistry, Model Development and Validation, and Model Applications. Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
J. Fell, and I. Hunter.
Antonie van Leeuwenhoek, Vol 40, No 2, p 307-310, 1974. 8 ref.

Descriptors: *Yeasts, *Antarctic Ocean, Water pollution sources, Water pollution, Pollutants, Water quality, *Pollutant identification.
Identifiers: *Troulopsis austromarina, New species.

A new species of yeast, Torulopsis austromarina, has been found in the oceanic waters of the Indo-Pacific and Indian Ocean parts of the Antartic. T. austromarina is related to T. inconspicua but T. inconspicua can not assimilate galactose, trehalose, inulin or soluble starch and has a higher maximum temperature. (Orr-FIRL)

cta Adriat, Vol 15, No 4, p 1-19, 1974, Illus.
dentifiers: *Contact water(Oil), Methodology, Oceanographic methods, *Oil pollution, Terstrial waters, *Pollutant identification, Sulfate alance.

method is described making it possible to deterine contact waters (water containing natural etroleum) among natural waters of all types. Two ew properties have to be found: the sulfate alance (SB), (equal to the loss of sulphate during e diagenesis of the water) and the index of aeraon (IA). Data from various countries including umania, Yugoslavia and the near east are given dicating a strong correlation between the negave values of SB and the occurrence of oil in the yers from which water samples were taken. A milar correlation is found for the IA of water and e oil occurrence in the strata. The SB and the IA ow the recent formation of contact water in the ea sediments. The method can sometimes give inrmation prior to boring for oil which concerns e content of oil in the strata. The methods of nding the values of the 2 new parameters are also ven.--Copyright 1974, Biological Abstracts, Inc.

nodes.
pplied Microbiology, Vol 24, No 3, p 378-383, ptember, 1972. 6 tab, 12 ref.

Descriptors: *Feed lots, *Farm wastes, Runoff, Waste disposal, Recycling, Sampling, Microorganisms, Cattle, Pollutant identification, Water pollution sources, Public health.
Identifiers: *Enterobacteria, Refeeding, Health hazards.

Refeeding of wastes is currently being investigated as a possible means of combating vast accumulations of waste from animal production. However, little attention has been given the possible microbiological aspects of feedlot waste. This study was done to determine the types of microflora found in feedlot waste and associated sites. Samples were taken from feedlot waste, runoff from the pens, and water from a large drainage ditch at the feedlot, and they were examined for Enterobacteriaceae. Five-hundred and fifty-three cultures were isolated. Feedlot waste contains about 50,000,000 enterobacteria per gram. More than 90% of these were Escherichia coli. Enrichment techniques allowed isolation of four Proteus spp., both Providencia spp., Klebsiella, Enterobacter aerogenes, Arizona, and single isolate of Salmonella. Neither Arizona nor Salmonella were isolated from the drainage ditch or runoff. Results indicate that the refeeding of unsterilized feedlot waste is potentially hazardous due to the wide spectrum of enterobacteria found in these wastes. (Russell-East Central)

Societe Lyonnaise des Eaux et de l'Eclairage (France). Laboratoire.
J. Mallevialle.
Water Research, Vol 8, No 12, p 1071-1075, 1974. 4 fig, 2 tab, 11 ref.

Descriptors: *Analytical techniques, *Fuels, *Oil wastes, *Organic compounds, *Water analysis, Solvent extraction, Chemical analysis, Water pollution, Separation techniques, Analysis, Water pollution sources, Measurement, Estimating, Instrumentation, Oil, Gasoline, Oil pollution, Water pollution, Spectroscopy, *Pollutant identification.
Identifiers: *Carbon tetrachloride extraction, Florisil.

An analytical method for the determination of hydrocarbons in water by carbon tetrachloride extraction and infrared measurement of absorption was presented. It was found that 0.1 mg/l of hydrocarbons in water can be measured by extraction with carbon tetrachloride, florisil chromatography, and measurement of absorption over the 3000-2800/cm infrared range. While most interference is eliminated by chromatography, the method is unsuitable for aromatic hydrocarbons. Because of its relatively high sensitivity and particularly because of its rapidity and simplicity, the method is highly competitive with other methods, including gaseous phase chromatography. CHEMICAL AND PHYSICAL CHARACTERIZATION OF TAR SAMPLES FROM THE MARINE ENVIRONMENT,
Shell Development Company, Houston, Tex. Bellaire Research Center.
P. R. Mommessin, and J. C. Raia.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-787 788, $7.25 in paper copy, $2.25 in microfiche. Report No CG-D-20-75, p 240, June 1974. 2 fig, 7 tab, 8 ref, 6 append. DOT-CG-23,379-A.

Descriptors: *Waste identification, *Water pollution, *Oceans, *Pollutant identification, Analytical techniques, Chemical properties, Physical properties, Wastes, Water pollution sources, Mass spectrometry, Spectroscopy, Microscopy, Palynology, Sulfur.
Identifiers: Carbon isotope ratio, Tar samples.

A physical and chemical characterization of tar samples recovered from the marine environment was carried out. The task included the measurement of 32 physical and chemical parameters, photography, and microscopic analysis of each sample. Two distinct types of tar samples were indicated. One type appears to be urban and industrial waste products. The other includes petroleum-based materials which have been modified in varying degrees by weathering processes operating in the marine environment. This type included materials which were relatively high in sulfur and might originate from the sulfur-rich crudes known to be transported in the vicinity of their collection. Many of the petroleum-based samples contained substantial paraffinic material with a volatility distribution characteristic of that reported for materials found in discharge from tankers during tank cleaning operations. Particularly distinctive results were obtained from the volatility distribution. Other parameters such as sulfur content, carbon isotope ratios, pristane/phytane ratio, mass spectral analyses, and, to some extent, infrared analyses were also productive. The appendixes contain a description of analytical methods, many photographs and photomicrographs, results of a palynological study, and tables, charts, and analyses describing the analytical results. DETERMINATION OF THE MOLECULAR SOLUBILITY OF NAVY OILS IN WATER,
Naval Ordnance Lab., White Oak, Md.
M. G. Lai, and C. E. Adams.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-784 414, $3.75 in paper copy, $2.25 in microfiche. Report No NOLTR 74-110, p 21, June 1974. 4 fig, 6 tab, 5 ref.

Descriptors: *Solubility, *Osmosis, *Oil pollution, Oil, Organic compounds, Aqueous solutions, Membrane processes, Separation techniques, Methodology, Measurement, Pollutant identification, Water pollution sources.
Identifiers: Dispersed oil.

A method for the determination of true molecular solubility of hydrocarbons in water was developed. The method, based on the principle of osmotic pressure, was capable of measuring true soluble hydrocarbon concentration in the presence of dispersed hydrocarbon in water. The method was applied to the determination of the molecular solubility of Navy oils in water. The solubility was found to be dependent on the water-to-oil ratio, and the rate of dissolution was a function of agitation of the water-oil mixture. (Sims-ISWS)

Available from the National Technical Information Service, Springfield, Va. 22161, as AD-786 353, $3.25 in paper copy, $2.25 in microfiche. NRL Memorandum Report 2883, p 15, August 1974. 4 fig, 5 tab, 10 ref.

Descriptors: *Oil spills, *Sampling, Liquid wastes, Surfaces, *Oil pollution, *Pollutant identification.
Identifiers: *Oil-layer thickness, Polyurethane foam, Hydrophilic teflon.

Two uncomplicated devices were developed to determine the thickness of petroleum films on water. Both techniques use oil collectors which quantitatively remove the oil layer from a known surface area. The devices are weighed before and after being placed on the oil-covered water, and a small correction factor for entrained water is applied to the calculation of oil layer thickness. Reticulated, polyurethane foam discs are mounted in an open-ended cylinder to form a floating oleophilic sponge. When placed on the water, oil is absorbed within the confined cylindrical area. For thicknesses of Navy distillate fuel oil between 0.25 and 20 mm, the accuracy of the floating absorber is plus or minus -4.8%, and for No. 5 fuel oil thicknesses between 0.5 and 6 mm, accuracy is plus or minus 7.9%. The second collector, a hydrophilic Teflon sheet, removes thin layers of oil from water upon contact. Satisfactory oil layer thickness results are obtained between 65 and 300 micrometers for heavy oils. For lighter oils, the hydrophilic sheet method is valid only between 30 and 85 micrometers. However, because of its chemically inert character, the hydrophilic Teflon collector is useful for sampling spills for chemical identification and analyses. (Sims-ISWS)

ROUTINE SURVEILLANCE ALTERNATIVES FOR WATER QUALITY MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
R. C. Ward.
Journal Water Pollution Control Federation, Vol 46, No 12, p 2645-2652, December 1974. 1 fig, 18 ref. EPA Project 16080 FUO.

Descriptors: *Management, *Automation, *Monitoring, *Water quality control, Abatement, Baseline studies, Data collections, Remote sensing, *Sampling, Water quality standards, Water pollution control, Water pollution, *Colorado, Alternative planning.
Identifiers: Automatic monitoring, Grab sampling.

Grab sampling, automatic monitoring, and remote sensing techniques were reviewed and the adequacy of their respective roles in providing data bases suitable to the needs of water quality management programs and the character of the water to be managed were examined. Traditionally, grab sampling techniques have been used in documenting trends used in preventive strategies but have limited effectiveness for providing data on extreme water quality of the type needed for abatement activities. Automatic monitoring may be used to supplement grab sampling in a cost-effective manner within certain limitations. Remote sensing is not practical at the present time for routine water quality surveillance because of the high cost involved. However, its spatial coverage may provide a large amount of information in inventory and special survey work. (Harmeson-ISWS)

WATER QUALITY BY PHOTOGRAPHIC ANALYSIS,
Wisconsin Univ., Madison.
S. A. Klooster, and J. P. Scherz.
Photogrammetric Engineering, Vol 40, No 8, p 927-935, August 1974. 10 fig, 1 tab, 15 ref.

Descriptors: *Water quality, Management, *Water pollution, *Aerial photography, Turbidity, Air-water interfaces, Reflectance, Suspended solids, Sampling, Remote sensing, *Pollutant identification.
Identifiers: *Infrared film, *Microdensitometers, Bottom effects, Path luminance.

Five years of research have resulted in a workable and practical aerial reconnaissance technique for correlating water quality parameters to aerial photographs. A positive correlation was determined between reflectance of water and the water quality parameter of turbidity. This relationship is permanent for any particular waste. At certain times other parameters such as suspended solids, correlate to turbidity and may be mapped. Proper analysis of aerial photographs in determining water reflectance requires a standard reflectance panel somewhere in the frame. For such investigation color and color-infrared film are utilized and analyzed with a color microdensitometer which, with some modification, is employed to analyze reflectance of water samples. Noise in the analysis consists of bottom effects, reflection from the air-water interface, and path luminance; all of which may be dealt with by proper techniques. (Leibowitz-FIRL)

SOLUBILITY STUDIES OF METALLIC MERCURY IN PURE WATER AT VARIOUS TEMPERATURES,
Middle East Technical Univ., Ankara (Turkey). Dept. of Chemistry.
E. Onat.
Journal of Inorganic Nuclear Chemistry, Vol 36, No 9, p 2029-2032, September 1974. 3 fig, 2 tab, 24 ref.

Descriptors: *Mercury, *Solubility, *Spectrophotometry, Ions, *Ultraviolet radiation, Aqueous solutions, Heavy metals, *Pollutant identification, Analytical techniques.
Identifiers: *Mercurous perchlorate, Ionic dissociation, Dimeric mercury, Beer's Law, *Metallic mercury.

A method employing ultraviolet spectrophotometry was developed for a direct analysis of soluble mercury in aqueous solutions at various temperatures. Soluble mercury is converted into mercurous form in the presence of mercuric ions, and the absorbance of mercurous perchlorate measured at a wavelength of 236.5 nm was utilized for the quantitative determination of mercury in water. A determination can be made of mercury in as small an amount as 3 x 10 to the minus seventh power g-atom/liter. Twenty-three samples at 6 different temperatures were analyzed, with a standard deviation from compiled data of 0.004. A solubility curve was made on the basis of the results of this experiment. There was no indication of ionic dissociation in dimeric mercury or of deviation from Beer's law. (Leibowitz-FIRL)

WASTEWATER ANALYSIS AND ITS RELATION TO COMPANY PROFITS,
Harnish and Lookup, Associates, Newark, N.Y.
J. A. Kem, and R. Wilson.
Industrial Wastes, Vol 22, No 3, p 26-28, 52, May/June 1974. 8 fig, 2 tab.

Descriptors: *Waste water treatment, *Water pollution, *Industrial wastes, *Food processing industry, Sampling, Discharge, Effluent control, *Pollutant identification.
Identifiers: Peanut butter, Tomato products, Grape products.

In-plant sampling and waste water analysis to estimate the waste water resulting from increased output at the Red Wing Company of Fredonia, New York, was initiated so that individual sources of waste water discharge could be identified for individual control and/or elimination. The program was divided into two parts: an extensive in-plant analysis of the individual process lines and , the unit operation in each line. The sampling included grab samples with measured flow, grab samples with estimated flows, samples composited by flow, and samples composited with time. To double-check, the total waste water loads calculated from production records were compared to the results of a second sampling program on the control plant effluent. The production of jams, jellies, peanut butter, tomato products, grape juice and grape products were investigated. On the basis of the individual unit process sampling results, waste water discharge was accurately predicted for a particular day. It was also determined which production operations result in large waste loadings and which do not. By knowing the individual flows that attend each process, it was possible to determine when processing personnel became careless and discharge more than necessary for given unit operation. (Leibowitz-FIRL)

ASBESTIFORM AMPHIBOLE MINERALS: DETECTION AND MEASUREMENT OF HIGH CONCENTRATIONS IN MUNICIPAL WATER SUPPLIES,
Duluth, Minn. National Water Quality Lab.
P. M. Cook, G. E. Glass, and J. H. Tucker.
Science, Vol 185, No 5154, p 853-855, September 6, 1974. 2 fig, 18 ref.

Descriptors: Pollutants, *Water supply, *Municipal water, Lake Superior, Measurement, Fibers, Sampling, *Minnesota, *Pollutant identification, *Asbestos, Analytical techniques.
Identifiers: *Asbestiform amphibole minerals, Duluth(Minn).

Asbestiform amphibole minerals, which are associated with human health problems, were detected in substantial quantities in minicipal water supplies taken from western Lake Superior water. The total concentrations of amphibole minerals in the Duluth, Minnesota, water supply, were measured by x-ray diffraction of daily samples of suspended solids. They averaged 0.19 milligram per liter with large fluctuations due to seasonal and climatological effects on lake circulation. Electron microscopic examination of these water samples confirmed the presence of asbestiform amphibole fibers. A conservative estimate of the fiber count for 1973 Duluth water supply samples is one to thirty million amphibole fibers identifiable by electron diffraction per liter of water, with a mass concentration of one to thirty micrograms per liter. (Prague-FIRL)

SPHERE METHOD TURBIDIMETER,
Nippon Precision Optical Instrument, Co. Ltd., Tokoyo (Japan).
K. Sato.
Chemical Economy and Engineering Review, Vol 6, No 5, p 26-30, May 1974. 7 fig.

Descriptors: *Turbidity, *Suspended matter, Instrumentation, Effluents, Pre-treatment, Measurement, Activated sludge, Polymers, Pollutant identification, Waste water treatment, Analytical techniques.
Identifiers: *Turbidimeters.

he presence of suspended matter in pre-treated ffluents poses some problems such as an increase n fluid resistance and fluid film thickness. To emove solids attached to the membrane , it is im-ortant to measure and control the suspended natter in a given sample. A new instrument, the oic Sphere-Method Turbidimeter, is useful in nalysis of fine amounts of impurities. It operates n the principle of measuring both dispersive and arallel transmissions and comparing the two eadings: turbidity = Td/Tp x 100 percent. Experi-ents in Japan used the Turbidimeter to control ne quality of seawater and to analyze regional dif-erences in the suspended solids of different sea-vater. A positive relationship was found between rbidity and solid suspension. Applications of this strument include pollution control by measuring spended solids, oil concentration, and activated udge after pre-treatment; atmospheric research y measuring particulate concentrations; and, a ariety of applications in petrochemical and etroleum industries, pharmaceutical industries, nd high polymer industries. 972), 12 p, 27 ref.

escriptors: Analysis, *Farm wastes, *Tests, athogenic bacteria, Air pollution, Water pollu-on, Bacteria, Coliforms, Sampling, Microorgan-ms, Ecology, *Pollutant identification, Analyti-al techniques, *Biological properties.
dentifiers: Fecal coliforms, Fecal streptococci, otal plate count.

ecause of the growing concern in the control of ollution and environmental hazards it is impera-ve that some standardization of tests be eveloped in the field of waste analysis. Many of ne problems encountered in the analysis of animal astes are caused by the variability of the crude roduct. Measurements or analyses of domestic nimal wastes fall into three main categories: (1) tandardized tests that have gained professional, overnmental, and judicial status; (2) tests which etect disease-causing organisms; and (3) tests for rganisms that cause pollution to the environment nd are involved in the aesthetic quality of agricul-ral businesses. The basic standardized tests are or total coliforms, fecal coliforms, enterococci or ecal streptococci, and total plate counts. In the etection of pathogenic organisms there are stan-ardized tests for a broad array of organisms. In ne tests for organisms that cause pollution, varia-les such as temperature, pH, salts, nutrients, ox-gen, moisture, nitrogen compounds, and minerals nould be taken into account because they affect ne growth of organisms. NITROGEN RELEASE ASSOCIATED WITH THE DECREASE IN SOIL ORGANIC MATTER IN NEWLY CULTIVATED SOILS,
Technion - Israel Inst. of Tech., Haifa. Soils and Fertilizers Lab.
T. Reinhorn, and Y. Avnimelech.
Journal of Environmental Quality, Vol 3, No 2, p 118-121, April-June, 1974. 2 tab, 2 fig, 18 refs.

Descriptors: *Nitrates, *Potable water, *Soils, *Leaching, *Water pollution, Nitrogen, Cultivated lands, Soil water, Drainage water, Organic matter, Aquifers.
Identifiers: Virgin soils.

High nitrate concentration in sources of drinking water is a world-wide problem. A marked decrease in soil organic matter has been observed during the first years following the cultivation of virgin soils. A series of comparisons between cultivated and virgin soil plots were used to study the release of nitrogen as a result of this cultivation. Results from the area show that the decrease in organic nitrogen from the soil is rather rapid and a steady state is achieved during the first few years. During a certain transition period, the decrease in organic matter in the soil could account for increases in nitrate contents of drainage water. This transition period appears to be short in warm and dry climates, but could be more significant in cold and humid regions were organic matter contents of soils are high. (Mastic-Arizona)

THE USE OF CHIRONOMID PUPAL EXUVIAE FOR CHARACTERIZING STREAMS,
Bristol Univ. (England). Dept. of Zoology.
R. S. Wilson, and P. L. Bright.
Freshwater Biol. Vol 3, No 3, p 283-302. 1973 Illus.
Identifiers: *Chironomid pupal exuviae, *Stream classification, *United Kingdom(River Chew), *Path of pollutants.

Samples of chironomid pupal exuviae were collected by drift netting in the River Chew, Somerset (England) over a period of 4 yr. The samples were analyzed for precentage composition of types and in some cases for numbers of exuviae per unit volume of water sampled. Surface samples contained many more exuviae per unit volume sampled than subsurface samples in the same place, and the catch taken by adjacent nets varied by up to 4 times. The percentage composition of exuvial types remained very consistent under all sampling conditions. Samples taken from other rivers show both similarities and differences between themselves and the River Chew in percentage composition of types. In the River Biss, Wiltshire, a marked change in the exuvial types collected downstream from a sewage effluent outfall was shown after improvements were made to the sewage works. Spring samples from the River Chew showed a change from Tanytarsini- to Orthocladiinae-dominated populations between 1970 and 1972. In the River Chew, exuviae suspended in the stream disintegrated after approximately 1-2 wk. Colored polystyrene balls were used to investigate the downstream movement of floating material in the River Chew. The average stream flow rate was 0.36 m/sec. Some evidence is presented to show that the exuviae float for only about 2 hr in the River Chew before sinking. It is suggested that the area from which most of the sampled exuviae are derived is limited on the River Chew to, at most, 400 m upstream. Provisional identification to genus is given for those exuvial types mentioned. The possibility of using chironomid exuvial analysis as a method of characterizing streams is discussed.--Copyright 1974, Biological Abstracts, Inc.

THE UNRELIABILITY OF TILE EFFLUENT FOR MONITORING SUBSURFACE NITRATE-NITROGEN LOSSES FROM SOILS,
G. W. Thomas, and B. J. Barfield.
J Environ Qual. Vol 3, No 2, p 183-185. 1974 Illus.
Identifiers: Drainage, Effluents, *Monitoring, *Nitrate-Nitrogen, Soils, *Tile effluents, *Path of pollutants, Fertilizers, Water pollution sources.

Investigation of a completely tiled field showed that only a small proportion of the total flow reaching the drainage ditch came from tile effluent. In 2 measurements 63 and 89% of the flow to the drainage ditch came from seepage other than through tiles. The nitrate-N concentrations in the tile effluent were far higher than those calculated in the nontile flow by mass balance. Nitrate-N concentrations in tile effluents may not be reliable indicators of nitrate-N loses from agricultural land, when the tiles do not intercept all subsurface flow.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: *Anthropogenic fluoride, *Aluminum smelting wastes, Kitimat River estuary(Canada), Howe Sound(British Columbia).

This study was undertaken to better understand the effects of anthropogenic fluoride upon estuarine and marine ecosystems. A comparison of fluoride levels in Kitimat Arm, where fluoride wastes have been discharged for nearly twenty years, and of Howe Sound, British Columbia, where there is not known to be any input of non-natural fluoride, indicated that some contamination has occurred. A statistical treatment of the data further serves to demonstrate this conclusion. (Ott-FIRL)

A STUDY OF THE WASTE WASH WATER FROM EGG WASHING MACHINES,
Richard B. Russell Agricultural Research Center, Athens, Ga.
D. Hamm, G. K. Searcy, and A. J. Mercuri.
Poult Sci, 53(1): 191-197, Illus, 1974.
Identifiers: *Chemical oxygen demand, Egg washing machines, Solids, Waste wash, Water pollution sources, Industrial wastes, Southeast U.S.

The egg washer waste waters from 11 grading and breaking plants in the Southeast were sampled and characterized for the common pollution parameters. Egg grading plants studied used an average of 4.6 l of water per case for egg washing. Breaking plants used 3.4 l of water per case for washing. Measured median waste concentrations for the wash waters were: for the grading plants-Chemical Oxygen Demand (COD) 7300 mg/l, total solids 9300 mg/l, volatile solids 4600 mg/l; for the breaking plant washers-COD 22,500 total solids 27,000, and volatile solids 16,6000 mg/l.--Copyright 1974, Biological Abstracts, Inc.

PETROLEUM HYDROCARBONS IN NARRAGANSETT BAY: I. SURVEY OF HYDROCARBONS IN SEDIMENTS AND CLAMS (MERCENARIA MERCENARIA),
Woods Hole Oceanographic Institution, Mass. Dept. of Chemistry.
J. W. Farrington, and J. G. Quinn.
Estuarine Coastal Mar Sci, Vol 1, No 1, p 71-79, 1973. Illus.
Identifiers: Bays, *Clams, Mercenaria-mercenaria, *Oil pollution, Petroleum, Pollution, *Sediments, Sewage, Survey, Oil spills, *Massachusetts(Narragansett Bay), Pollutant identification.

Analyses of hydrocarbons in surface sediments from 8 stations in clams (M. mercenaria) from 3 stations in Narrangansett Bay show that both contain a very complex mixture of hydrocarbons which is not present in clams from Charlestown Pond, a relatively unpolluted coastal pond. This complex mixture of hydrocarbons is present in crude and fuel oils and it is not a likely product of recent biosynthesis by marine organisms. The sediments and clams from the areas sampled in Narrangansett Bay are probably contaminated by petroleum hydrocarbons. Sewage effluents and small oil spills are the most probable sources of the petroleum hydrocarbons. (See also W75-04478)--Copyright 1974, Biological Abstracts, Inc.

PETROLEUM HYDROCARBONS IN NARRAGANSETT BAY: II. CHEMICAL AND ISOTOPIC ANALYSIS,
Woods Hole Oceanographic Institution, Mass. Dept. of Chemistry.
O. C. Zafiriou.
Estuarine Coastal Mar Sci, Vol 1, No 1, p 81-87, 1973. Illus.
Identifiers: Agriculture, Bays, Carbon-14, Chemical analysis, Forests, Isotopic analysis, Microorganism, Oil, Petroleum, Sediments, Sewage, Oil spills, *Massachusetts(Narragansett Bay), Oil pollution, *Pollutant identification.

Upper Narragansett Bay surficial sediments contain a complex mixture of hydrocarbons at over 10 times the levels of the lower Bay. 14C and chemical analyses indicate that petroleum is the predominant source of these hydrocarbons; the data exclude as predominant sources microbiologically synthesized hydrocarbons, land runoff, domestic wastes and forest and agricultural products. The hydrocarbons are characterized by low 14C content, by the presence of over 1000 components, including the isoprenoid hydrocarbons pristane and phytane and several homologous series of alkylaromatic compounds. The ubiquitous normal alkanes are not present in significant amounts. Sewage effluents and small oil spills discharged to Narragansett Bay may be chemically modified by evaporation, dissolution and partial biochemical oxidation to yield the observed hydrocarbon distribution. DISSOLVED AND PARTICULATE HUMIC ACID IN AN EAST COAST ESTUARY,
Adelphi Univ., Oakdale, N.Y. Inst. of Marine Science.
M. E. Hair, and C. R. Bassett.
Estuarine Coastal Mar Sci, Vol 1, No 1, p 107-111, 1973, Illus.
Identifiers: Coasts, *Estuary, *Humic acid, Particulates, Salinity, Seasonal, *Path of pollutants.

Seasonal variations in dissolved and particulate humic acids were studied for a 1 yr period in an East Coast estuary. Particulate humic acids accounted for the bulk of the 2 fractions. The general seasonal trend of both fractions showed a sharp increase in concentrations in the spring followed by a decrease during the summer and winter months. Concentrations of humic acids were related to salinity levels in this stratified system.--Copyright 1974, Biological Abstracts, Inc.

A SYSTEMS ANALYSIS OF WATER QUALITY SURVEY DESIGN,
Clemson Univ., S. C.
L. C. Wilcox, R. W. Gilchrist, M. Wolla, J. F. Andrews, and B. E. Gilliland.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD 787 529, $5.25 paper copy, $2.25 microfiche. Department of the Army, Second Annual Report. U.S. Army Medical Research and Development Command, Washington, D.C., July 1974. 101 p, 10 fig, 2 tab, 2 append.

Descriptors: *Systems analysis, *Water quality control, *Surveys, *Design, Measurement, *Simulation analysis, *Water sampling, Monitoring, Data collections, Management, Sewers, Networks, Mathematical models, Computer programs, Path of pollutants.
Identifiers: Army ammunition plants, Manufacturing processes.

The design of water quality surveys is being investigated in a 3-year project by an interdisciplinary team using systems analysis; this is the second annual report. The surveys being studied are 15 days in length and designed to characterize pollutant types and levels at the site being monitored. Needed are a 'best' sampling and analysis program to maximize data collection and an information management system. Each principal process associated with munitions manufacture is modeled to provide a pollutant load as a function of production level. These process models, plus a topological model of the plant site which defines the sewer network, produce the steady-state pollutant load at each point in the sewer network and at the plant effluent points. These are combined with a model defining United States Army Environmental Health Agency resources available for measurement, sampling, and analysis. The resulting resource matching model defines the feasible monitoring schemes and gives an indication of performance and utilization of resources. The second year's work reported here involved: creation of a library of processes sufficient to describe 6 different types of munitions manufacturing plants; changes in the process model to allow for differences in plants; collection of data for refinement of resource and topology models; improved user-model interface; demonstration of survey planning program on two sites; development and demonstration of data handling software; and documentation and workshops. REDUCING FEEDLOT NITRATES IN YOUR GROUND WATER,
J. R. Watson.
Crops and Soils, Vol 24, No 3, p 17-18, December, 1971. 4 fig, 1 tab.

Descriptors: *Nitrates, *Feed lots, *Groundwater movement, Soil profiles, *Nebraska, Leaching, Sampling, *Water pollution sources.

U.S. Department of Agriculture/Agricultural Research Service and Soil and Water Conservation scientists, and the Department of Agronomy at the University of Nebraska have been studying the movements of nitrates and other solubles in soil profiles under beef cattle feedlots. In general, oxygen and nitrogen concentrations are considerably depleted, while carbon dioxide and methane are plentiful. The ammonium-nitrogen and total nitrogen concentrations are higher near the surface, although no nitrates were found. To guard against the possibility of nitrate leaching, however, the following procedures are recommended to all cattle farmers: avoid frequent and extensive scraping of the feedlot surface, and leave the surface soil relatively undisturbed when removing manure from the feedlot. On-lot decomposition is encouraged. In this way, leaching of the soil will be minimized as will its oxygen concentration. Low oxygen concentrations are desirable since oxygen interferes with the reducing environment in which nitrates are converted to harmless nitrogen gas. (East Central State College)

SURFACE WATER QUALITY IS INFLUENCED BY AGRICULTURAL PRACTICES,
Minnesota Univ., Morris.
R. F. Holt.
Transactions of the ASAE (American Society of Agricultural Engineers,) Vol 16, No 3, p 565-568, 1973. 3 tab, 34 ref.

Descriptors: *Surface waters, *Water quality, *Water pollution sources, *Fertilizers, *Farm wastes, Pesticides, *Agricultural runoff, Phosphorus, Nitrogen, Feed lots, Soil contamination, Diseases, Nutrients, Soil conservation, Waste disposal, Fishkills, *Biochemical oxygen demand.
Identifiers: Agricultural practices, Leptospirosis.

The effects of fertilizer runoffs, pesticides, and feed lot wastes on surface water quality are discussed. The three constituents of animal waste that pose a threat to water quality are BOD, infectious agents, and dissolved chemicals, which are primarily nutrients. Rapid influxes of animal waste into waterways can cause massive fish kills, due to reduced oxygen levels; constant, but less rapid, contamination will simply drive the fish away, killing only less mobile forms. Medium textured, well drained soil can degrade 250 to 300 lb of BOD per acre per day. The soil also quickly destroys pathogens, such as streptococcus, anthrax, hog cholera, and mastitis. Although few of these diseases infect man, all can be transmitted to other animals. Plant nutrients, most frequently nitrogen and phosphorus, allowed to run off into streams, either directly from the feed lot or indirectly after application to frozen or saturated soils, are also detrimental to water quality. If manure is disced in as soon as applied, runoff of nutrients is avoided. (East Central State College)

THE DEVELOPMENT OF A MATHEMATICAL MODEL TO PREDICT RUNOFF WATER QUALITY FROM WATERSHEDS,
Texas A and M Univ., College Station.
J. B. Malouf.
Available from Xerox University Microfilms, Ann Arbor, Mich, 48106, Order No 74-21,211. Ph.D. Thesis, p 196, 1974.

Descriptors: *Mathematical models, *Urban runoff, *Water quality, *Surface runoff, Storm runoff, Precipitation(Atmospheric), Runoff forecasting, Watersheds(Basins), Hydrographs.
Identifiers: Qual Model.

A mathematical model, the Qual Model, to predict the quality of watershed runoff has been developed. Runoff that moves over a basin and the pollutants that are dissolved or suspended in it are evaluated. The pollutants are substances generally deposited as a result of human activity within the basin that are present on streets, surfaces, sidewalks, driveways, roofs, grassed areas, alleys, gutters, and storm drains. The model is based on the assumption that the rate of pollutant removal by surface runoff is proportional to the amount of pollutant remaining and to the runoff intensity. The pollutants found on the basin before rain are obtained from literature and used to evaluate the quality of runoff with respect to time from any watershed. The simulation of urban runoff considers the urban runoff process as composed of precipitation, runoff, and quality which interact to predict the quality found in urban storm water runoff. The model may be applied to any watershed if the basic hydrographic data and surface characteristics are known. Improvements need to be incorporated into this model as more data and a further understanding of the basic mechanisms involved become available. (Orr-FIRL)

WASTEWATER CHARACTERIZATION FOR THE SPECIALTY FOOD INDUSTRY,
American Frozen Food Inst., Washington, D.C.
C. J. Schmidt, E. V. Clements III, and J. Farquhar.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Corvallis, Oregon, Report EPA-660/2-74-075, p.134, December 1974, 25 tab, 2 append. 1BB037, EPA Grant No R-801684.

Descriptors: *Industrial wastes, *Foods, Canneries, *Waste Identification, Waste treatment, Water pollution control, Water pollution sources, Waste water treatment.
Identifiers: Specialty foods, *Waste characterization.

The specialty food industry generally falls within standard industrial classification (SIC) Codes 2032, 2035 and 2037 and includes approximately 2,300 plants in the United States which produce a wide variety of food products. For waste categorization purposes the specialty food industry was divided into ten categories on the basis of ingredients used, type of product, and liquid waste generation. Twenty-six nationally distributed specialty food plants were investigated and 24 of these field sampled for ten days each to determine raw wastewater characteristics and volume. Related production and processing information was used to calculate the wastewater generation per 1,000 kilograms of production in terms of: 5 day Biochemical Oxygen Demand, Chemical Oxygen Demand, Suspended Solids, Volatile Suspended Solids, Total Phosphorus, Total Kjeldahl Nitrogen, and Grease and Oil. MERCURY IN AQUATIC SYSTEMS: METHYLATION, OXIDATION-REDUCTION, AND BIOACCUMULATION,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
H. W. Holm, and M. F. Cox.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C.20402, price $1.05. Environmental Protection Agency, Corvallis, Oregon, report EPA-660/3-74-021, p 38, August 1974. 3 fig, 12 tab, 42 ref, 3 append. ROAP 21 AIM Task 11.

Descriptors: *Heavy metals, *Aquatic bacteria, *Food chains, Microbiology, Fish food organisms, Growth rates, *Mercury, Trace elements, *Path of pollutants, Absorption.
Identifiers: *Transformations, *Methylmercury, Bioaccumulation, Methylation.

The role of organisms on the fate of mercury in aquatic environments was evaluated. Objectives were (1) to quantitate transformations of mercury in water-sediment systems, (2) to investigate the fate of elemental mercury in microbial growth systems, and (3) to measure the concentration of total and methylmercury in food chain organisms. In anaerobic water-sediment systems spiked with calcium acetate and mercuric chloride, elemental mercury was produced in larger quantities than methylmercury. The rate of methylation of mercury in aerobic environments was comparable to that in anaerobic environments; however, the rate of release of elemental mercury to the atmosphere during aerobic incubation was nearly three times that observed during anaerobic incubation. No dimethylmercury was produced in these systems. In water-sediment systems, added elemental mercury was oxidized and deposited in the sediments where small amounts of methylmercury were formed. Six pure cultures of bacteria oxidized elemental mercury, but none formed methylmercury. Two Pseudomonas species did not grow in the presence of elemental mercury. In a stream receiving mercuric ion, mosquito fish contained more methylmercury than did tadpoles, snails, and aquatic insects. Algae did not contain methylmercury, even though their total mercury levels were high. (EPA)

ORGANIC COMPOUNDS ENTERING GROUND WATER FROM A LANDFILL,
Oklahoma Univ., Norman. School of Civil Engineering and Environmental Science.
J. Robertson, C. R. Toussaint, and M. Jorque.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 237 969, $4.25 paper copy, $2.25 microfiche. Environmental Protection Agency, Report EPA-660/2-74-077, September 1974, 47 p, 7 fig, 6 tab, 24 ref. 21 AKQ, Task 13, EPA R801417.

Descriptors: *Groundwater movement, *Landfills, *Water pollution sources, *Organic compounds, *Leachate, Water pollution, Water pollution control, Organic wastes, Gas chromatograph, Mass spectrometry, Path of pollutants, Activated carbon, Polychlorinated biphenyls, Environmental effects, Aquifers, Sampling, Organic acids, Pollutant identification.
Identifiers: *Carbon adsorption method, Organic Carbon, Refuse, Industrial organic chemicals.

Organic compounds leached into ground water from a landfill containing refuse deposited below or near the water table were investigated. Ground water from wells within or near the landfill and a control well was sampled by modified low-flow carbon adsorption procedures incorporating all glass-teflon systems to preclude introduction of extraneous organics. Column chromatography, solubility separation, and gas chromatography-mass spectrometry were employed for separation, identification, and quantitation of individual compounds in organic extracts. The ground water was shown to contain low levels of many undesirable organic chemicals leached from the landfill. Of those compounds identified (over 40), most were chemicals commonly employed in industry for manufacturing many domestic and commercial products. The source of these compounds was apparently manufactured products discarded in the landfill, since it had not received appreciable wastes from industrial operations. Because the age of the refuse in the area studied was at least three years, the compounds identified were believed to be substances leached very slowly from the refuse and/or transported away from the landfill very slowly because of adsorption on aquifer solids. Potential long-term pollution of ground water by industrial organic chemicals from landfills may be indicated by this work. (EPA)
W75-04573

ACID-IRON WASTE AS A FACTOR AFFECTING THE DISTRIBUTION AND ABUNDANCE OF ZOOPLANKTON IN THE NEW YORK BIGHT: II. SPATIAL VARIATIONS IN THE FIELD AND IMPLICATIONS FOR MONITORING STUDIES,
Harvard Univ., Cambridge, Mass. Biological Labs.
P. H. Wiebe, G. D. Grice, and E. Hoagland.
Estuarine Coastal Mar Sci. Vol 1, No 1, p 51-64. 1973 Illus.
Identifiers: *Acid-iron wastes, Biomass, Calanus-Finmarchicus, Distribution, *Monitoring, *New York Bight, Plankton, Pseudocalanus-Sp, Spatial variations, Temora-Longicornis, *Zooplankton.

A study was undertaken in the New York Bight in an effort to understand small scale variations of single populations and coastal zooplankton communities as they relate to the disposal of acid wastes. Two grids of 8 locations each, 1 day and 1 night station per location, were placed so that one covered the acid grounds and the other a similar area functioning as a control 9 km to the northeast. Thirty-nine taxonomic categories of zooplankton were counted from oblique net tow samples collected at the 32 stations. Biomass was determined from length measurements of individuals of 24 taxa. Species composition of the samples was typical of neritic waters of the northeast Atlantic coast. The spatial distribution of the majority of the species was markedly aggregated, but no trend was observed which would suggest that the acid wastes were an important factor in shaping the distributions. Species did not show collective agreement as to the area in which a higher average abundance for each occurred; and no significant trends in percent similarity or diversity (Simpson's D and the information theory H') were evident. Although Vaccaro et al. found zooplankton biomass to be approximately 30% higher from the control area than from the acid grounds, comparison of the biomass difference between the 2 areas on a species by species basis showed that 95% of the overall difference was accounted for by only 3 spp., Pseudocalanus sp. and its copepodids, Calanus finmarchicus copepodids and Temora longicornis. The acid-iron wastes appeared to be a minor factor affecting the distribution and abundance of zooplankton species during the time of this investigation. OPTIMAL WEIGHTING FUNCTION IN WATER QUALITY MODELING,
University of Southern California, Los Angeles. Dept. of Electrical Engineering, and Materials Science.
E. S. Lee, and P. K. Misra.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-234 419 $3.75 in paper copy, $2.25 microfiche. June 1973. 33 p, 10 fig, 3 tab, 49 equ, 5 ref. OWRT C-3051(No. 3678).

Descriptors: *Water quality, *Simulation analysis, *Mathematical models, *Optimization, Dissolved oxygen, Biochemical oxygen demand, Equations, Estimating, Least squares method, Time, Systems analysis.
Identifiers: *Weighting function, *Dynamic modeling, Gradient approach, Calculus of variations, Sequential search technique, Convergence rate.

In an earlier paper by Lee and Hwang (See W71-06587), the invariant imbedding concept was applied to the dynamic modeling of stream quality. In the approach presented herein, a set of weighting functions is introduced. The initial conditions for these weighting functions must be estimated. These initial conditions influence the convergence rate tremendously. In many water quality control situations, the number of experimental data points is limited. In order to obtain the best estimates with limited experimental data, the best convergence rate should be used. In this work, the least squares criterion combined with various optimization techniques, including a sequential search technique and a gradient approach, is used to obtain the optimal initial conditions for the weighting functions. The proposed schemes greatly improve the convergence rate. (Bell-Cornell)

NONPOINT AGRICULTURAL POLLUTION: STATUS OF ASSESSMENT METHODOLOGY,
Midwest Research Inst., Kansas City, Mo.
A. Aleti, S. Y. Chiu, and A. D. McElroy.
Paper No. 74-4025 presented at the 1974 Annual Meeting of American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974, 16 p, 2 fig, 2 tab, 27 ref.

Descriptors: Agriculture, *Water pollution sources, *Model studies, Nutrients, Microorganisms, Pesticides, Salts, Runoff, Pollutants, Forecasting, Sediments, Path of pollutants.
Identifiers: *Nonpoint pollution(Agricultural).

Agriculture is a major contributor to nonpoint pollution. Agriculture pollutes water with such substances as sediments, salts, nutrients, pesticides, biodegradable organics, and microbial populations. These pollutants are the result of natural factors and source practices. The present difficulty with nonpoint pollution control is the inability to assess, in quantitative terms, the effect of control measures. The overall need is to develop comprehensive models which include all pollutants, which are sensitive to the causes of these pollutants, and which recognize interdependencies between pollutants in order to facilitate development of simplified control measures. Some of the needs basic to the construction of these models are: data gaps; analyses of transport phenomena; evaluation of current and past case studies; model-orientated case studies conducted on a wide scope; collection and storage of information; and, systematic analysis of large volumes of data. (Russell-East Central)

FEEDLOT WASTE EFFECTS ON SOIL CONDITIONS AND WATER EVAPORATION,
Southwestern Great Plains Research Center, Bushland, Tex.
P. W. Unger, and B. A. Stewart.
Soil Science Society of America Proceedings, Vol 38, No 6, p 954-957, November-December, 1974. 2 fig, 1 tab, 14 ref.

Descriptors: *Soil water, *Feed lots, *Bulk density, Porosity, Organic matter, *Evaporation, *Farm wastes, Aggregation, Soil properties, Water pollution sources.

Feedlot wastes were applied to field plots at 0, 22, 67, 134, or 268 metric tons/hectare for 4 successive years. Core and bulk soil samples from the plots were used to evaluate treatment effects on soil water retention, bulk density, strength, porosity, organic matter content, and water-stable aggregates. Evaporation was determined from laboratory columns containing feedlot-waste-treated soil at the surface and untreated soil below the treated soil. For soils treated with feedlot wastes at high rates, water contents at saturation and at -0.2 and -1.5 bars matric potential were significantly higher, and bulk densities were significantly lower, than for untreated soils or those treated at low rates. Soil strength, porosity index

values, and water contents at -15 bars matric potential were not significantly affected by waste applications. Soil organic matter and aggregation increased and evaporation decreased as waste application rates increased. (Roberts-ISWS)
W75-04699

MICROMETEOROLOGICAL MEASUREMENTS FOR PESTICIDE DRIFT STUDIES,
Missouri Univ., Columbia. Dept. of Agricultural Engineering.
C. E. Goering, and B. J. Butler.
Transactions of the American Society of Agricultural Engineers, Vol 17, No 6, p 1104-1107, November-December 1974. 5 fig, 9 ref.

Descriptors: *Pesticide drift, *Micrometeorology, Atmospheric physics, Boundary layers, Winds, Bridges(Electric), Temperature, *Pesticide drift, *Path of pollutants.
Identifiers: Wind sensors, Thermistor bridges, Hygrothermographs, Temperature probes.

A weather instrumentation system was developed for use in pesticide drift studies initiated at the University of Illinois in the fall of 1972. A 10-m mast was erected in a level, open area for supporting the weather sensor. Six channels of strip chart recorder were used to record signals from three 3-cup anemometers, a microvane, a propeller anemometer, and a thermistor bridge. Mean values of these signals were obtained by planimetering the charts over 100 seconds of record. Mean values of horizontal wind were measured at 10-m, 2-m, and 0.5-m heights. A thermistor bridge measured the temperature difference between 2-m and 10-m height. Atmospheric instability was indicated by measuring vertical air speeds at 1 m with a propeller anemometer. A hygrothermograph and a microbarograph were used to record dry bulb temperature, relative humidity, and atmospheric pressure. Data collected were in reasonable agreement with accepted micrometeorological theory. (Roberts-ISWS)

SUBSURFACE SEWAGE DISPOSAL AND CONTAMINATION OF GROUND WATER IN EAST PORTLAND, OREGON,
Oregon State of Environmental Quality, Portland. Water Quality Div.
E. L. Quan, H. R. Sweet, and J. R. Illian.
Ground Water, Vol 12, No 6, p 356-367, November-December 1974. 8 fig, 1 tab, 10 ref.

Descriptors: *Water pollution, *Cesspools, *Septic tanks, *Domestic wastes, *Soil disposal fields, Nitrates, Water pollution sources, Groundwater movement, Deep percolation, Groundwater recharge, *Oregon, *Path of pollutants, Pollutant identification.
Identifiers: Multnomah County(Ore), Portland(Ore).

East Portland and central Multnomah County have changed from a rural-suburban to a locally urban community with community water and sewer. However, a 30-square mile area within central Multnomah County remains usewered and reportedly disposes of 8 to 10 mgd sewage via cesspools, seepage beds, and drainfields. These methods of waste disposal have resulted in the degradation of the groundwater resource. Central Multnomah County receives groundwater recharge from the Cascade Mountains to the east and intermediate recharge from the Cascade foothills and other isolated hills bordering and within the area. The primary groundwater recharge source is infiltrating precipitation. However, due to development and its attendant reduction in infiltration area, there has been a decrease in natural recharge. The domestic waste which is disposed of via the subsurface is introduced as supplemental local recharge. The depth to which the local recharge can penetrate the water table is limited by its hydraulic potential and the vertical hydraulic conductivity of the substrata. Therefore, the NO3-N contaminated recharge is effectively buoyed up and migrates laterally along the upper portion of the water table to its eventual surface drain, Columbia Slough South Arm. Water samples from wells developing water in adjacent or upgradient sewered areas and/or from deeper aquifers within the unsewered area generally have NO3-N concentrations of less than 1 mg/1. Shallower wells and springs within the unsewered area and South Arm Slough, downgradient from the unsewered area, had NO3-N concentrations ranging from 4.7 to 11.86 mg/1, with a mean value of 7.74 mg/1 in July 1974. SAMPLING OF VARIABLE, WASTE-MIGRATION PATTERNS IN GROUND WATER,
Michigan State Geological Survey, Lansing.
K. E. Childs, S. B. Upchurch, and B. Ellis.
Ground Water, Vol 12, No 6, p 369-376, November-December 1974. 4 fig, 2 tab, 15 ref.

Descriptors: *Water pollution sources, *Septic tanks, *Path of pollutants, *Michigan, *Water pollution, Waste water(Pollution), Sampling, Monitoring, Chemicals, Soil contamination, Groundwater movement, Adsorption, Investigations, Measurement, On-site data collections, On-site investigations.
Identifiers: *Waste migration, *Plumes, Houghton Lake(Mich).

A survey of waste-migration patterns from septic-tank/tile-field systems surrounding Houghton Lake, Michigan, indicated that sampling plans designed to detect and quantify waste migration in groundwater should be predicted on the concept that the waste plume may be complex and that the plume may not follow regional, groundwater flow. The waste-migration plumes at Houghton Lake range from simple, multichemical plumes that move with regional flow to complex plumes that bifurcate, that show different migration patterns for different chemicals, and that move up the regional gradient for short distances. The complexity of these patterns was attributed to a combination of the following system properties: loading rate and recharge at the waste source, local hydrology, chemical-adsorption capacity of the soil, soil microbiology, regolith texture and fabric, and proximity to other waste sources. Based on the observed patterns, it was suggested that observation wells be placed so that an in-depth, 3-dimensional array of samples can be obtained. The wells should be of sufficient depth to insure that deep-moving plumes can be detected and, if the actual, vertical-migration pattern is of importance, the wells should allow collection of water samples at a number of depths. The waste-migration pattern should be monitored throughout the year in anticipation of vertical movement of the plume axis during periods of surface recharge. If more than one chemical is of interest, then it unsafe to assume that an index chemical, such as chlorides, demonstrates the migration of the other chemicals and analyses must be run for the other chemicals. WILL CURRENT RESEARCH ANSWER TODAY'S PROBLEMS AT THE SANITARY LANDFILL.,
Auburn Univ., Ala. Water Resources Research Inst.
J. C. Warman, R. K. Rainer, and A. S. Chipley.
Ground Water, Vol 12, No 6, p 378-386, November-December 1974. 1 fig, 1 tab, 1 ref, 1 append.

Descriptors: *Landfills, *Waste disposal, *Waste dumps, *Solid wastes, *Alabama, Leachate, Soil management, Environmental engineering, Public health, Garbage dumps, Ultimate disposal, Monitoring, Inspection, Wastes, Water pollution sources, Regulation, Research priorities, Management, Training.
Identifiers: *Sanitary landfills.

Alabama's solid waste management program has been commended repeatedly by the U.S. Environmental Protection Agency for establishing and operating throughout nearly all of the state effective, county-wide, state-approved, rural solid waste collection and disposal systems. The program is administered and regulated by the Division of Solid Waste and Vector Control of the Environmental Health Administration. Collecton systems, sanitary landfills, and other parts of the program are rated by the regulatory agency; rating of landfills is used in enforcement. In 1974, 87.0% of the 67 counties in Alabama representing 97.0% of the total state population of 3,444,000 had total collection and disposal systems. The two greatest problems in the sanitary landfill program are disposal of hazardous industrial wastes and training of operators. Current research throughout the nation on groundwater pollution related to sanitary landfills was reviewed to identify expected research results that will help solve the problems. (Sanderson-ISWS)

SOURCES OF METALS IN NEW YORK CITY WASTEWATER,
New York City Dept. of Water Resources. Industrial Wastes Control Section.
L. A. Klein, M. Lang, N. Nash, and S. L. Kirschner.
Journal Water Pollution Control Federation, Vol 46, No 12, p 2653-2662, December 1974. 1 fig, 13 tab.

Descriptors: *Water pollution sources, *Domestic wastes, *Industrial wastes, *Metals, *Storm water, *Water supply, Cadmium, Chromium, Copper, Effluents, Heavy metals, Nickel, Runoff, Sludge, Sludge disposal, Waste water treatment, Zinc, Atlantic Ocean, New York, Hudson River.
Identifiers: *New York City(NY).

In an attempt at rendering as strict an accounting as possible for copper, chromium, nickel, zinc, and cadmium found in New York City waste-

waters, samples from industrial effluents, surface runoff, waste treatment plant influents and effluents, the water supply, and the rivers and harbors were extensively analyzed. Results indicated that contributions of metals to wastewater from the electropolating industry may be significantly overshadowed by those from non-industrial sources which are more difficult to control. Electroplating is the largest single contributor of both chromium and nickel. On the other hand, water supply, storm water runoff, and residential wastes are larger contributors of copper and zinc. Cadmium contributed by residential wastes exceeds that from the electroplaters. Extensive tabulations of total daily weights of metals and average concentrations were presented. (Harmeson-ISWS)

TRACE METALS IN WASTEWATER EFFLUENTS,
University of Southern California, Los Angeles. Environmental Engineerig Program.
K. Y. Chen, C. S. Young, T. K. Jan, and N. Rohatgi.
Journal Water Pollution Control Federation, Vol 46, No 12, p 2663-2675, December 1974. 8 fig, 7 tab, 6 ref.

Descriptors: *Centrifugation, *Metals, *Filtration, *Waste water treatment, Cadmium, Chromium, Copper, Iron, Lead, Manganese, Mercury, Nickel, Zinc, Effluents, Sediments, Sludge, Separation techniques, *Trace elements, Pacific Ocean, *California.
Identifiers: Atomic adsorption, Los Angeles(Calif).

Because of the nature of its primary and secondary treatments and the discharge of wastewater and sludge effluents, the Hyperion Treatment Plant, Los Angeles, California, was selected for an intensive study to characterize trace metals in the effluents of different waste treatment processes. The chief concern of the study was the portioning of trace metals into the dissolved and particulate phases and the size distribution of the particulate-borne fractions in wastewater effluents and digested sludge. With the exception of nickel, mangenese, and lead, secondary treatment was found to be moderately effective in removing trace metals in the particulate fraction. On a dry weight basis, trace metals in the particulate fractions of wastewater effluents and digested sludge were found to be within a narrow range. (Harmeson-ISWS)

WATER QUALITY OF STORM RUNOFF FROM A TEXAS BEEF FEEDLOT,
Abraham Baldwin Agricultural Coll., Tifton, Ga.
G. G. Wise, and D. L. Reddell.
Paper No 73-441 presented at 1973 Summer Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973. 23 p, 9 fig, 5 tab, 23 ref.

Descriptors: *Water quality, *Storm runoff, *Texas, *Cattle, *Feed lots, Measurement, Sampling, Drainage area, *Farm wastes, Path of pollutants, Water pollution sources.

A study of feed lot runoff was conducted fr nine months on a 10,000 head feed lot. Over 250 runoff samples were collected from 11 natural storms on two drainage areas. Approximately .5 inch of rainfall was generally required to initiate runoff. Relationships between volatile solids, total solids, and chemical oxygen demand were established. Storm pattern and size had little effect on the average concentration of a chemical element. Chemical oxygen demand, phosphorus, and Kjeldahl nitrogen followed the variations in total solids concentrations. Potassium, sodium, and chloride and filterable solids were not related to the sediment load. Most chemical constituents' concentrations were greater from area one than from area two, probably because of a greater slope at area one. (Frantz-East Central)

OXYGEN SAG AND STREAM PURIFICATION, (LITERATURE REVIEW),
Georgia Dept. of Natural Resources, Atlanta.
L. A. Neal.
Journal of the Water Pollution Control Federation, Vol 46, No 6, p 1413-1418, June, 1974. 56 ref.

Descriptors: *Aeration, *Oxygen sag, *Stream purification, Photosynthesis, Nitrification, Stochastic processes, Estuaries, Runoff, Reaeration, Biochemical oxygen demand, *Reviews, *Bibliographies, Dissolved oxygen.
Identifiers: Benthic deposits, Dissolved oxygen models.

An extensive bibliography of U.S. and foreign literature on the aeration of natural waters was compiled. A generalized model including the effects of photosynthesis and nitrification was developed. Sornberger and Keshaven produced a stochastic DO simulation under constant and variable temperature conditions, comparing the range of probable DO concentrations against mean values from a deterministic model. A stochastic DO model for streams and estuaries was developed by Schofield and Krutchkoff and predicted values were compared against data from the Ohio River and the Potomac estuary. The method of moments, Reed-Theriault, Thomas slope, and log differences were used in estimating BOD data. Bochinski investigated the merits of the TOD test in using non-biological techniques for estimating BOD, and presented correlations to TOD to COD and TOD to BOD. The results of direct reaeration capacity measurements, employing a radioactive tracer gas for oxygen, and associated hydraulic properties in five rivers were presented by Wallace and Tsivaglou. (Leibowitz-FIRL)

5C. Effects Of Pollution

THE EFFECT OF TEMPERATURE AND CHEMICAL POLLUTANTS ON THE BEHAVIOR OF SEVERAL ESTURINE ORGANISMS,
Ichthyological Associates, Inc., Middletown, Del.
J. W. Meldrim, J. J. Gift, and B. R. Petrosky.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 347, $5.75 in paper copy, $2.25 in microfiche. Bulletin No 11, December 1974. 129 p, 17 fig, 57 tab, 31 ref. OWRT C-3041(No 3677)(1).

Descriptors: *Fish behavior, *Water pollution effects, *Delaware River, *Metabolism, *Thermal pollution, *Chlorine, *White perch, *Silversides, *Brackish-water fish, Striped Bass, Killifishes, Marine fish, Crabs, Fish physiology, Water temperature, Chemical wastes, Salinity, Dissolved oxygen, Light intensity, Regression analysis, Estuaries, Nuclear powerplants, Bioassay, Analytical techniques.
Identifiers: *Temperature avoidance, *Chemical avoidance, Scope for activity, Fish swimming speed, Hogchoker, Grass shrimp, Blue crabs, Sand shrimp, Hypochlorimeter.

The increased use of estuarine waters for cooling purposes by steam electric generating stations requires that responses of affected fishes and macroinvertebrates to temperature and to the antifouling chemical, chlorine, be known. Behavioral avoidance responses to temperature and to chlorine were determined under various combined conditions of salinity, light level, and level of dissolved oxygen over the annual range of temperatures found in the Delaware River estuary. Physiological responses in terms of metabolic rate and scope for activity were determined for different levels of salinity over the same annual range of estuarine temperatures. Multiple regression analysis was used to estimate avoidance temperatures, concentrations of chlorine which would be avoided, and active and resting metabolic rates. Acclimation temperature was the dominant factor influencing the response level in all these studies. However, the effects of the other variables under study significantly affected the response as well as the effect of acclimation temperature. Further, these variables were found to interact such that the effects of the individual variables were not consistent. In several cases, these interactions were more important in determining the response level than the main effects of their components. Data and graphs showing these effects are presented.

ROOKERY BAY: ECOLOGICAL CONSTRAINTS ON COASTAL DEVELOPMENT,
Conservation Foundation, Washington, D.C.
J. Clark.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 349, $5.25 in paper copy, $2.25 in microfiche. Partial Completion Report - Rookery Bay Land Use Studies, December 1974. 91 p, 17 fig, 9 tab, 34 ref. OWRT C-4022(No 9004)(5), C-1817(No 3170)(5), C-2201(No 3385)(5).

Descriptors: *Water pollution effects, *Water pollution sources, *Estuaries, *Water quality control, *Estuarine resources, *Planning, *Coasts, Management, *Flood protection, Wetlands, Zoning, Mangrove swamps, Legislation, Sediments, Eutrophication, Water circulation, Salinity, Turbidity, *Florida, Land use, Urban runoff, Surface drainage, Ecosystems.
Identifiers: Critical area protection., Land use constraints, Development standards, Ecosystem protection, Ecologically vital areas, Socio-economics, *Rookery Bay(Fla).

A coastal ecosystem was identified and analyzed to determine the needs and possibilities for protective management through controlling human activities which would adversely affect its natural drainage system estuarine resources. Three years of monthly sampling of the estuarine biota, and water chemistry, and continuous monitoring of tides and circulation, provided the basis for a detailed description of estuarine resources and amanagement diagnosis of its condition. Watershed vegetation, soils, and hydrology were surveyed. From this data base requirements for protection of the water system estuarine resources were determined. Social, economic, and land use surveys provided the basis for recommending a management plan consisting of: A system of identification of all water areas by use of vegetative indicators; specific development standards restricting water areas to light duty recreation use; contingency standards for low density residential development of water areas that cannot be

stricted to light recreational use; a plan for a 0,000-acre protected natural estuarine corridor r recreation and resource protection, and con-ols on land clearing and site preparation in the atershed. The management program is integrated ith provisions of the Federal Flood Disaster Pro-ction Act of 1973.

COLOGICAL HISTORY OF DDT IN RIZONA,
rizona Univ., Tucson.
W. Ware.
urnal of the Arizona Academy of Science, Vol No 2, p 61-65, June 1974. 6 tab, 1 fig, 14 ref.

escriptors: *DDT, *Agricultural chemicals, esticides, *Arizona, Irrigation, Ecology, Histo-, Agronomic crops, Insecticides, Pesticide sidues.

DT first appeared in Arizona in 1943, for experi-ental purposes. Beginning in 1946 and for the xt 20 years it was used primarily on cotton and getable crops at the rate of 1 to 3 pounds per re. The estimated use on irrigated agricultural ops in 1959-60 was 4 million pounds annually. In 64, due to hay and milk contamination the use of DT was restricted to spray application. Failure to duce the milk and beef contamination problem used a moratorium to be placed on the agricul-al use of DDT by the U.S. Food and Drug Ad-nistration in 1969. This made Arizona the first te to have such a ban. The moratorium was re-ated in 1970, 1971, and 1972 until 1973 when the ncellation of all DDT uses in 1973 by the En-ronmental Protection Agency resulted in a na-nwide ban. (Mastic-Arizona)

escriptors: *Radioactivity, *Radioisotopes, adiation effects, Animal physiology, *Age, ongevity, Laboratory animals, Biology, En-ronmental effects, Public health.
entifiers: *Mice, *Dose-rate.

adult population of strain RF female mice were nditioned with 13 discrete doses of cobalt-60 mma rays ranging from 457 to 3455 rad given at a se rate of 2.76 rad/h. Median after-survival nes of conditioned groups were compared with ntrol nonconditioned groups to determine life-rtening effects of gamma rays given at a rela-ely low dose rate. No linear dependence of life rtening on dose was observed. The average life rtening for all conditioning doses used was 83 ys (0.04 day/rad). The relatively small life-shor-ing effects observed were attributed to several ctors, including age at exposure and dose rate, d not to dose rate alone. (Houser-ORNL)

RADIATION PHYSICS,
Battelle-Pacific Northwest Labs., Richland, Wash.
L. H. Toburen, W. E. Wilson, L. Porter, S. T. Manson, and H. G. Paretzke.
In: Report BNWL-1850, Part 4, p 41-53, February 1974. 9 fig, 44 ref.

Descriptors: *Research and development, *Radiation, Physics, *Radioactive effects, *Biology, Materials, Ions, Ionization, Biological control, Biochemistry, Transport, Theoretical analysis, Evaluation, Prototype tests, Model studies, Speciation.
Identifiers: *Electrons.

The radiation physics program addresses three major research problems associated with understanding the effects of radiation on materials of biological significance. Electron emission from atoms and molecules bombarded by protons is studied to provide information on the primary collision processes. This information is then used to formulate descriptions of track structure and the interaction of ionizing tracks with volumes of biological and biochemical importance. Finally, the mechanism of energy transport and transformation from the energetic initial processes into chemical species is studied using time resolved luminescence. Electron emission cross sections have been improved for the very important low-energy electrons ejected from several gas targets. Theoretical studies of the angular distribution of ejected electrons have continued with a marked improvement for the lower energy electrons. Monte Carlo calculations of track structure and microdosimetric parameters have been started and the results are proving useful in formulating better initial conditions for the distribution of active species. This will permit development of more realistic models for radioluminescence. (See also W75-04410) (Houser-ORNL)

RADIATION DOSIMETRY,
Battelle-Pacific Northwest Labs., Richland, Wash.
W. C. Roesch, and L. A. Braby.
In: Report No BNWL-1850, Part 4, p 55-69, February 1974. 11 fig, 48 ref.

Descriptors: *Research and development, *Radiation, *Radioactivity, *Measurement, *Assay, Radioactivity effects, Environmental effects, Biology, Theoretical analysis, Statistics, Nuclear energy, Physics, Biology, Biochemistry.
Identifiers: *Dosimetry, Dose rate, Dosimetric parameters.

The development of an understanding of radiation effects on living systems at the cellular level continues to be the objective of the Radiation Dosimetry program. The emphasis is on the theoretical development and experimental realization and measurement of those physical parameters that appear appropriate for describing radiation effects. The major theoretical thrust has been on expanding the statistical theory to (1) more adequately incorporate dose rate and recovery effects, (2) examine the applicability of microdosimetric parameters, and (3) accommodate sublethal effects. This theory is then applied to a variety of published experimental radiobiological data to demonstrate its effectiveness in correlating the data. The microscopic distribution of energy in an irradiated absorber continues as an active topic of theoretical and experimental investigation. The major experimental effort, however, has been directed toward bringing to fruition a wide range of irradiation facilities for use in the Radiation Biophysics program. Facilities now provide the capability of irradiating cell monolayers and tissue culture with pulsed, monoenergetic protons, electrons, and filtered 330 kVp x rays. A wide range of dose rate, LET, and dose fractionation are now available with well-documented dosimetric parameters. (See also W75-04410) (Houser-ORNL)
W75-04414

RADIATION BIOPHYSICS,
Battelle-Pacific Northwest Labs., Richland, Wash.
W. C. Roesch, M. H. Schneiderman, L. A. Brady, and D. S. Nachtwey.
In: Report No BNWL-1850, Part 4, p 71-83, February 1974. 8 fig, 1 tab, 48 ref.

Descriptors: *Research and development, *Radiation, *Radioactivity effects, *Environmental effects, Biology, *Biological control, Biochemistry, Mammals, Nuclear energy, Cytological studies, Theoretical analysis, Mathematics, Model studies, Analytical techniques, Technology.
Identifiers: *Dosimetry, *Mutations.

In an effort to understand the effects of radiation on biological systems at the cellular level, two systems were chosen to study at sublethal radiation levels. The CHO is a mammalian cell line amenable to detailed investigation of radiation-induced division delay and radiosensitivity changes near the end of the cell cycle. Theoretical effort has been on mathematically describing the progression of cultured cells through the division cycle and formulating plausible models to account for the biochemical processes that are perturbed by radiation. The experimental emphasis has been in carefully selecting and characterizing the cell line to be used throughout the course of these collaborative experiments. Tissue culture techniques have also been perfected that will allow irradiation under the physically well-defined beams of monoenergetic protons and electrons. A second biological system, the single celled organism Chlamydomonas reinhardi, is being studied with particular attention being directed to its unique mutagenic behavior. Close coordination of experimental design, including dosimetric and biological considerations, and theoretical interpretation continue to be of central importance in this program. MEDICAL USES OF ISOTOPES,
Battelle-Pacific Northwest Labs., Richland, Wash.
F. P. Hungate, D. H. Lester, W. F. Riemath, L. R. Bunnell, and M. F. Gillis.
In: Report No BNWL-1850, Part 4, p 89-96, February 1974. 7 fig, 5 ref.

Descriptors: *Research and development, *Human pathology, *Diseases, *Toxicity, Mammals, Biology, Radioactivity effects, Bioindicators, Radioisotopes, Public health, Thulium, Strontium, Yttrium.
Identifiers: Dogs, *Clinical diagnosis.

An inexpensive portable blood irradiator for clinical use in suppressing circulating lymphocytes and organ graft rejection and a generator for Nitrogen-13 (T 1/2 = 10 min) suitable for clinical diagnosis are two applications for isotopes being investigated under this program. A new approach to blood irradiation has been developed using Thulium-170 cast as an integral part of a vitreous carbon body. Production of the irradiators does not involve personnel exposures since the 169Tm used is neutron activated after manufacture. Reactivation is anticipated as units lose effectiveness with the 125-day half-life of 170Tm. Total weight of units applicable to clinical practice is anticipated to be less than 1 kg. An irradiator using Stronium-90-Yttrium-90 was also constructed and tested in a dog. Alpha irradiation of Boron-10 is the basic route being investigated for the 13N hospital generator. Both 13N2 and 13NH3 have potential value as diagnostic pharmaceuticals. (See also W75-04410) (Houser-ORNL)
W75-04417

MEDICAL GRADE PLUTONIUM-238 FROM AMERICIUM-241,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. W. McKee.
In: Report No BNWL-1850, Part 4, p 97-98, February 1974.

Descriptors: *Research and development, *Radioisotopes, *Public health, *Evaluation, Safety, Plutonium, Americium, Economics, Fuel, Waste treatment, Biology, Bioindicators.
Identifiers: *Dosimetry, Clinical dosimetry, Therapy, Irradiation.

The objective is to compare and evaluate the relative economics and technical practicability of various approaches to producing both high-quality (low Pu-236 content) and high-purity (low dilution from other plutonium isotopes) Pu-238 by irradiating Am-241 recovered from spent power reactor fuel. The scope of the program includes (1) projecting the availability of Am-241, (2) identifying the process facilities required for americium recovery, and (3) identifying the optimum target irradiation and processing cycle. (See also W75-04410) (Houser-ORNL)
W75-04418

RECIPIENT RADIATION EXPOSURE - CIRCULATORY SUPPORT SYSTEMS,
Battelle-Pacific Northwest Labs., Richland, Wash.
F. T. Cross.
In: Report No BNWL-1850, Part 4, p 99, February 1974.

Descriptors: *Research and development, *Model studies, *Radioisotopes, *Heat, Radioactivity effects, Public health, Mammal, Bioindicators, Biology, Heat exchangers, Design criteria.
Identifiers: *Circulatory system, *Heat sources, Dose rates.

The objectives are to determine the dose from radioisotopic heat sources suitable for circulatory support systems and to develop radioisotopic heat source holders and shams for use in an animal study to assess the combined effects of heat and radiation from implanted plutonium heat sources. Improved input data and an ancillary code developed for specification of source strength and spectra have been used in parametric computations of dose rates to organ systems and whole body. Conceptual designs of heat source holders for abdominal implantation of heat sources have been completed. (See also W75-04410) (Houser-ORNL)
W75-04419

POPULATION RADIATION EXPOSURE,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. W. McKee.
In: Report No BNWL-1850, Part 4, p 101-104, February 1974.

Descriptors: *Research and development, *Nuclear energy, *Beneficial use, *Public health, *Human population, Radioisotopes, Radioactivity effects, Bioassay, Evaluation, Safety, Surveys, Biology, Genetics, Data collections, Census.
Identifiers: *Dose, *Artificial heart recipients, Somatic effects.

The objective is to develop reliable estimates of the radiation doses to the population that would result from successful development and routine use of Pu-238 fueled artificial hearts. At the beginning of 1973, preliminary calcualtions indicated the most significant component of dose was that transmitted to spouses. Because the age and sex of persons exposed are critical factors in developing estimates of possible genetic or somatic effects, the objectives of the study were broadened to develop greater definition of the age and sex of persons potentially exposed. An extensive survey to collect required interpersonal distance data was carried out in the Salt Lake City area. To obtain required detailed descriptions of the household characteristics of potential artificial heart recipients, copies of the data tapes from the March 1972 Current Population Survey program were obtained from the Census Bureau, and a special computer program was written to process these tapes. At year end, the principal effort was being devoted to the computer program to carry out the detailed dose calculations and summations. (See also W75-04410) (Houser-ORNL)

BIOLOGIC DETECTION AND CONTROL OF WATER POLLUTION,
Clemson Univ., S. C. Dept. of Microbiology.
R. K. Guthrie, R. N. Ferebee, and D. S. Cherry.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 412, $3.75 paper copy, $2.25 microfiche. South Carolina Water Resources Research Institute, Clemson, Report No 40, April 1974. 39 p, 8 fig, 7 tab, 13 ref. OWRT A-022-SC (8).

Descriptors: Freshwater, *Bacteria, Herbicides, *Biocontrol, *Dissolved oxygen, Water temperature, *South Carolina, *Thermal pollution, Lakes, Water pollution effects, Bioindicators.
Identifiers: Bacterial populations, Thermal loading, Ambient temperatures, Bacterial diversity, Chromagenic bacterial populations, Lake Hartwell(SC), Lake Keowee(SC).

Dissolved oxygen, temperature and natural bacterial populations were determined in four systems at monthly intervals in terms of total plate counts, nutritional types, proportion of chromagenic bacteria, and number of colony types, for a period of one or two years and data were analyzed on a seasonal basis. The effects of thermal addition and chemical addition (herbicide pollution) were studied in various systems. In Lake Hartwell, S. C., total bacterial counts showed that seasonal cycles occur; highest counts were observed in the warmer months. Bacterial diversity and percent chromagens varied with seasonal temperatures. No detectable seasonal cycle in total plate counts was observed in Lake Keowee; high and low counts occurred randomly at various times during the year. In fast flowing aquatic systems at Savannah River Project, seasonal cycles were observed in all systems; highest counts were detected during warmer months. Bacterial diversity and percent chromagens varied with temperatures. Of three herbicides tested, one resulted in increased total populations, one did not significantly alter bacterial populations, and the third resulted in significant decreases in total populations. Effects of thermal addition on bacterial populations varied according to the nature of the aquatic system, the generic composition present, and the degree of thermal addition in relation to ambient temperatures.

INTERRELATIONS BETWEEN SULFATE-REDUCING AND METHANE-PRODUCING BACTERIA IN BOTTOM DEPOSITS OF A FRESH-WATER LAKE. I. FIELD OBSERVATIONS,
Hydrobiologisch Institutt, Nieuwersluis (Netherlands).
T. Cappenberg.
Antonie van Leeuwenhoek, Vol 40, No 2, p 285-295, 1974. 3 fig, 2 tab, 28 ref.

Descriptors: *Bacteria, *Methane bacteria, *Sulfate-reducing bacteria, Freshwater bacteria, Water pollution sources, Water pollution, Sand pits, Methane, Redox potential.
Identifiers: *Acetate, *Seepage, *Lake Vechten(Netherlands).

Observations on the seasonal periodicity in the bottom deposits of Lake Vechten indicate that an ecological relationship exists between the methane-producing and the sulfate-reducing bacteria. The sulfate-reducing bacteria are most abundant at depths of 0 to 2 cm in the mud at hydrogen sulfide potential values around 11 and redox potential values between 100 and 150 mV. The methane-producing bacteria are most abundant at depths of 3 to 6 cm and at hydrogen sulfide potential values around 14 and redox potential values between 250 and 300 mV. During the summer stratification, the numbers of both groups of bacteria rose but the methane-producers increased much more than the sulfate-reducers. The abundance of the sulfate-reducers is limited by the sulfate concentration in the interstitial water of the mud. Methane-producers are at greater depths in

e mud than the sulfate-reducers and the concen-
ation of hydrogen sulfide is less. It is concluded
at the different locations of the bacterial groups
ay be due to sensitivity of the methane-produ-
rs to hydrogen sulfide. (See also W75-04470)

possible substrate interrelationship between
ethane-producing and sulfate-reducing bacteria
s been studied in bottom deposits of Lake
echten. The inhibition of methanogenesis in mud
mples by chlorine-containing analogues of
ethane resulted in an accumulation of acetate.
uoroacetate reduced the concentration of
ethane by about 75 percent. If carbon
rachloride was used, an accumulation of
drogen gas was observed. These results indicate
t acetate is the main precursor of methanogene-
in mud. After addition of beta-fluoroacetate,
cumulated and H2S was no longer produced,
ich indicates that lactate is the main source of
ergy for sulfate reduction in mud. Simultane-
sly, the concentration of methane increased.
is may be due to the lower concentration of
S, which has a toxic effect on methanogenesis.
periments with intact mud cores have provided
dence that the described phenomena occur also
situ. (See also W75-04469) (Orr-FIRL)

ODUCTION ECOLOGY OF TWO CARIBEAN RINE ECOSYSTEMS: I. PHYSICAL EN-RONMENT AND FAUNA,
erpool Univ., Port Erin (England). Dept. of
rine Biology.
R. R. C. Edwards.
Estuarine Coastal Mar Sce, Vol 1 , No 4, p 303-318, 1973. Illus.
Identifiers: Avoidance reaction(Fish), *Caribbean Sea, Diet, Econogy, *Ecosystems, Effluents, *Fauna, Fish diets, Marine, Mud, Physical environment, *Production, Sand, Weed, Water pollution effects.

A quantitative study was made of the invertebrate macrofauna and fish fauna of 2 shallow water ecosystems. One was in an inlet on a clean sand bottom (1) while the other was on a muddy bottom (2) near a discharge point for domestic effluent. The largest average biomass of littoral infauna of 2.894 g/m2 dry flesh weighr was found at (2) while the largest average biomass of sublittoral infauna of 5.839 g/m2 found at (1). Fish biomass was 5.048 g/m2 at (1) and 1.200 g/m2 at (2) suggesting an avoidance reaction to the contaminated water at the latter locality. Diets of demersal fish were predominantly benthic infauna at (1) and epifauna at (2), the latter being related to the presence of a prolific week fauna in the sublittoral. PRODUCTION ECOLOGY OF TWO CARIBBEAN MARINE ECOSYSTEMS: II. METABOLISM AND ENERGY FLOW,
Liverpool Univ., Port Erin (England). Dept. of Marine Biology.
R. R. C. Edwards.
Estuarine Coastal Mar Sci, Vol 1, No 4, p 319-333, 1973, Illus.
Identifiers: Aerobic conditions, Algae, Caribbean Sea, *Ecology, *Ecosystems, Effluent, *Energy flow, Fish, Invertebrates, Marine, *Metabolism, Plankton, Primary production, Respiration, Water pollution effects.

Primary production and respiration of 2 marine ecosystems were studied by measuring changes in dissolved O2 levels. In 1 of the ecosystems, on a clean sand bottom, energy input from bethic primary production and planktonic sedimentation was fully utilized by the benthic communities (e.g. fish, invertebrates), the former contributing 62% and the latter 38% of input. In the other ecosystem, which received domestic effluent from a city, total energy input to the bottom was higher due to increased sedimentation and production of benthic macroalgae. About half of the input to this system was utilized in aerobic respiration, while the remainder entered the anaerobic system where deposition occurred. Growth, respiration and turnover rates are discussed together with estimates of ecological efficiencies. (See also W75-04479)--Copyright 1974, Biological Abstracts, Inc.

INTERNAL WAVES AS CAUSATIVE MECHANISMS OF ISLAND MASS EFFECTS,
Bellairs Research Inst., St. James (Barbados).
F. Sander.
Caribb J Sci, Vol 13, No 3/4, p 179-182, 1973. Illus.
Identifiers: Internal waves, *Island mass effects, *Nutrient exchange, Plankton, Productivity, Thermocline, Waves(Water), *Entrophication, *Oligotrophic seas, Water pollution effects.

Enrichment by land drainage and a nutrient exchange between benthos and overlying waters are generally regarded as the major causes of an 'island mass' effect in tropical oligotrophic seas. It is postulated that internal waves, which were shown to oscillate vertically over an island shelf in conjunction with high nutrient concentrations below the upper limit of the shallow water thermocline, may also act as a principal causative mechanism by which inshore island waters are enriched. This source of repeated enrichment operates to support increased plankton populations and productivity inshore indicative of an 'island mass' effect.--Copyright 1974, Biological Abstracts, Inc.

ABUNDANCE, DIVERSITY AND SEASONAL PATTERNS OF ESTUARINE FISH POPULATIONS,
Environmental Protection Agency, Washington, D.C. Office of Technical Analysis.
A. J. McErlean, S. G. O'Connor, J. A. Mihursky, and C. I. Gibson.
Estuarine Coastal Mar Sci Vol 1, No 1, p 19-36, 1973. Illus.
Identifiers: Abundance, Diversity patterns, Energy, *Estuarine environment, *Fish populations, *Maryland(Patuxent estuary), Sampling, *Seasonal patterns, Steam electrical powerplants, *Thermal pollution.

Fish populations of the middle Patuxent Estuary in Maryland were sampled over a 4-yr period with quarterly frequency using 3 sampling gears: haul-seine, beam trawl and otter trawl. Data from each quarterly collection at 50 stations were examined using a 3-dimensional grid to check for possible effect due to a steam electrical generating station (s.e.s.). No marked s.e.s. effect was noted although occasional temporal shifts were noted. Trend analyses were performed for the number of species, number of individuals and several diversity indices. All analyses show strong seasonal cycles that are related to the nursery function of the estuary and to migratory activities. Regression lines fitted to the cyclic-trend patterns all show decreasing functions with time. These patterns suggest that a loss in diversity, as measured by these indices, had occurred. These changes are interpreted as being caused by a true loss of species in some cases and a shift in population structure in others. Possible explanations for the trends are examined and the implication of the trends are discussed. Should these trends continue, structural complexity of an already simple system will be reduced and increased amounts of energy may be diverted to dominant forms. The altered system, because of the loss of buffering capacity provided by alternate food web interconnections, may become subject to crashes and booms.--Copyright 1974, Biological Abstracts, Inc.

LITTORAL FISH POPULATIONS AFTER AN OIL TANKER DISASTER IN THE FINNISH SW ARCHIPELAGO,
Turku Univ. (Finland). Archipelago Research Inst.
J. Mankki, and J. Vauras.
Ann Zool Fenn Vol 11, No 2, p 120-126, 1974. Illus.
Identifiers: Disasters, Emulsifiers, *Finnish archipelago, *Fish populations, Gasterosteus-aculeatus, Growth rates, *Littoral, *Oil spills, Phoxinus-phoxinus, Pungitius-pungitius, Oil pollution.

Littoral fish populations of areas of the Baltic Sea affected by an oil spill from a tanker were examined 2 yr after the disaster occurred. The most frequent species were Phoxinus phoxinus (L.), Gasterosteus aculeatus (L.) and Pungitius pungitius (L.). The aim was to ascertain whether the oil, and the emulsifiers used to repel it, had had long-term effects on these species. The fish were caught with a beach seine in June and July, 1971. Their age, growth, condition factor and regression coefficient of log length on log weight were studied in several populations. No statistically significant differences were found between populations of 3 oil-polluted areas and a control area. The effects of oil and emulsifiers on the fish and the situation after the disaster are discussed.--Copyright 1974, Biological Abstracts, Inc.

THE EFFECT OF SALINITY AND IONIC EQUILIBRIUM ON CONTAMINATION OF ARENICOLA MARINA L. (ANNELIDA:

POLYCHAETA) BY CESIUM-137, (IN FRENCH),
Commissariat a l'Energie Atomique, Fontenay-aux-Roses (France). Service de Recherches Toxicologiques et Ecologiques.
C. Amiard-Triquet.
J Exp Mar Biol Ecol Vol 15, No 2, p 159-164, 1974.
Identifiers: Annelida, *Arenicola-marine, *Cesium-137, Coelomic, Contamination, Fluid, *Ionic equilibrium, Polychaeta, *Salinity, Sands, Food chains, Water pollution effects.

The fixation of 137Cs on fine sand with Arenicola increases when the salinity or the K content of water is decreased. The contamination of Arenicola by 137Cs was, therefore, higher than in normal sea water. The concentration factors for sea water diluted to 60% or with a K level of 50% were twice those for normal sea water, except for the coelimic fluid, the concentration factor of which remained constant. Several sssumptions can explain the process: a weaker competition between ions at the lower concentrations; substitution of K by Cs; parallel contribution of Cs and K in maintaining the internal environment more hypertonic than the external environment and contamination via the food chain in desalinated sea water.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF HEATED DISCHARGE WATERS FROM THE 'SKAWINA' ELECTRIC POWER STATION ON THE ICHTHYOFAUNA OF THE RIVERS SKAWINKA AND VISTULA,
P. Epler, and K. Bieniarz.
Acta Hydrobiol, Vol 15, No 3, p 331-339, 1973, Illus.
Identifiers: Alburnus-alburnus, Barbus-barbus, Electric powerplants, Fauna, *Heated discharge, Ichthyo, Leuciscus-cephalus, Leuciscus-leuciscus, Rivers, Seasonal, *Poland, Skawinka River, Vistula River, *Thermal pollution, Water pollution effects.

Investigations on the influence of heated waste waters discharged into the Skawinka and Vistula Rivers (Poland) showed that except in the hottest seasons of the year fish gather in the area of heated waters. In high water temperatures (20C and 28C for not heated and heated waters respectively) the total number of fish caught decreased. It was found that such species as Leuciscus cephalus (L.), Alburnus alburnus (L.), Barbus barbus (L.) and L. leuciscus (L.) are highly eurythermic.--Copyright 1974, Biological Abstracts, Inc.

THE EFFECT OF COOLING WATER DISCHARGES ON ZOOPLANKTON IN A BAY OF LAKE MALAREN,
Uppsala Univ. (Sweden). Inst. of Zoology.
M. Lanner, and B. Pejler.
Inst Freshwater Res Drottningholm Rep, 53, p 31-33, 1973, Illus.
Identifiers: Bays, *Cooling water discharges, Lakes, Plankton, *Polyarthra-remata, Sewage, *Sweden(Lake Malaren), Winter, *Zooplankton, *Thermal pollution, Water pollution effects.

A relatively high frequency of species, as well as individuals, was noted in the middle of winter (March 1972) in the inner part of Vasteras Bay (Sweden), which is affected by cooling water discharges from 2 power stations and by municipal sewage from the city of Vasteras. In a strip of open water in the ice just outside one of the power stations, where the temperature at some places exceeded +9C, a warmwater stenothermal rotifer occurred, Polyarthra remata, previously never found in the winter.--Copyright 1974, Biological Abstracts, Inc.

NITROGEN FIXATION (ACETYLENE REDUCTION) BY PHYTOPLANKTON IN GREEN BAY, LAKE MICHIGAN, IN RELATION TO NUTRIENT CONCENTRATIONS,
Illinois Univ., Urbana. Dept. of Botany.
L. N. Vanderhoef, C.-Y. Huang, R. Musil, and J. Williams.
Limnol Oceanogr, Vol 19, No 1, p 119-125, 1974, Illus.
Identifiers: *Acetylene reduction, Aphanizomenon-sp, Bays, Diatoms, Gloeotrichia-sp, *Green Bay(Wis), Growth, *Lake Michigan, Microcystis-sp, *Nitrogen fixation, Nutrients, Phosphates, *Phytoplankton.

N fixation (acetylene reduction) and the growth of blue-green algae (Aphanizomenon sp., Microcytis, sp., Gloeotrichia sp.) were studied in Green Bay (Lake Michigan) during summer 1972. Where concentrations of all nutrients were high Microcystis predominated. As combined N concentrations decreased Aphanizomenon increased. Aphanizomenon showed increasing C2H2-reducing efficiency as the NH4+ + NO3- concentration declined, but its standing crop decreased with declining P concentration. At 40 km from the Fox River diatoms were predominant. Increased algal growth and N fixation in 1972, as compared to 1971, correlated with higher phosphate concentrations. Almost half as much N was added to the bay by fixation as was delivered by the Fox River during the same period.--Copyright 1974, Biological Abstracts, Inc.

A NEW TECHNIQUE FOR THE STUDY OF EPIPHYTIC ALGAE,
Clayton Junior Coll., Morrow, Ga.
H. D. Brown.
Limnol Oceanogr, Vol 19, No 1, p 151-152, 1974.
Identifiers: *Algae, Colonization, *Epiphytic algae, Mayaca-aubleti, Scirpus-confervoides, Sphagnum-macrophyllum, Websteria-submersa, *Analytical techniques, *Macrophytes, Lakes.

Several species of aquatic macrophytes are capable of growing both submerged and as terrestrial plants near the shoreline of lakes (Scirpus confervoides (=Websteria submersa sensu Small), Mayaca aubleti Michx. and Sphagnum macrophyllum Bernh.). Rapid colonization by algal epiphytes follows submergence of the land form of these plants and can then be correlated with a definite period of time, whereas the time of attachment of communities on naturally growing macrophytes is unknown.--Copyright 1974, Biological Abstracts, Inc.

BENTHIC COMMUNITY RESPIRATION NEAR THE WOODS HOLE SEWAGE OUTFALL,
Woods Hole Oceanographic Institution, Mass.
K. L. Smith, Jr., Gilbert T. Rowe, and Jean Ann Nichols.
Estuarine Coastal Mar Sci, Vol 1, No 1, p 65-70, 1973, Illus.
Identifiers: Antibiotics, Bacteria, *Benthic community, Fauna, Flora, Formalin, *Massachusetts(Buzzards Bay), Oxygen, *Respiration, Sediment, *Sewage outfalls, Absorption, *Water pollution effects.

Effects of the Woods Hole, Massachusetts sewage outfall on the surrounding benthic community were examined. In situ O2 uptake measurements of the sediment were made before and after treatment with antibiotics and formalin. Total O2 consumption was 67.8 ml O2 m-2 h-1 of which 15.0 ml O2 m-2 h-1 was attributable to the chemical demand of the sediment. Community respiration was 52.8 ml O2 m-2 h-1 with bacterial respiration representing 34% of the biological demand. Total O2 uptake, chemical demand and bacterial respiration were significantly higher than values obtained in the control area in Buzzards Bay. Macrofaunal and meiofaunal-microfloral-microfaunal respiration were estimated from structural data and the literature. Utilization and accumulation organic enrichment is discussed.--Copyright 1974, Biological Abstracts, Inc.

ON THE VULNERABILITY OF ECOSYSTEMS DISTURBED BY MAN,
California Univ., Berkeley. Lawrence Berkeley Lab.
J. Harte, and D. Levy.
Technical report, LBL-3214. October 1974. 30 p, 5 fig, 6 ref. (Presented: First International Congress of Ecology, The Hague, Netherlands, September, 1974).

Descriptors: *Ecosystems, *Model studies, Stability, *Environmental effects, Flow, *Energy, *Nutrients, Methodology, Trophic, Equations, Measurement, Optimization, Water quality.
Identifiers: *Liapunov direct method, Environmental quality, Perturbations, Feedback, Sensitivity, Diversity.

The Liapunov stability theory is applied to models of energy and nutrient flow in ecosystems. The domain of stability under non-infinitesimal perturbations is discussed and significant differences are pointed out between models with and without detritus-decomposer feedback loops. Possible practical implications are suggested. Speculations concerning the role of fluctuations in ecosystems and the possibility of determining successional trends from an optimization procedure are also discussed. It is shown that increasing the number of trophic levels generally has no effect on the size of the domain of asymptotic stability; the exception to this occurs if the food web is not pyramidal in shape but rectangular or inverted. The damage to the decomposers or the organic or inorganic nutrient pools in an ecosystem is a potential source of instability--greater perhaps than that arising from tampering with the more visible predator-prey components of the system. (Bell-Cornell)

COMPARATIVE PHOTOSYNTHETIC CAPACITIES OF INTERTIDAL ALGAE UNDER EXPOSED AND SUBMERGED CONDITIONS,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
W. S. Johnson, A. Gigon, S. L. Gulmon, and H. A. Mooney.
Ecology. Vol 55, No 2, p 450-453. Illus. 1974.
Identifiers: *Algae(intertidal), *Photosynthesis, Desiccation, Endocladia-Muricata, Fucus-Distichus, Iridaea-Flaccida, Porphyra-Perforata, Prionitis-Lanceolata, Tidal, Ulva-Expansa, *Marine algae.

Photosynthetic rates were measured for 6 spp. of intertidal marine algae, in the air and submerged. Ulva expansa and Prionitis lanceolata, from the lower intertidal, show reduced photosynthetic capacity in air compared to submerged rates. In contrast, species from the middle and upper littoral (Iridaea flaccida, Porphyra perforata, Fucus distichus and Endocladia muricata) reached maximum photosynthesis after some degree of drying. For these latter species, photosynthetic rates can be 1.6-6.6 times greater in air than in water at the same illumination and temperature. Desiccation rates under natural conditions are slow enough that these algae are capable of continuing a high rate of photosynthetic activity for extended periods while exposed and may fix the bulk of their C at this time. The capacity of these algae for sustained photosynthesis in air vary according to their intertidal zonation. These relationships may be partially responsible for the vertical distribution of intertidal marine algae.--Copyright 1974, Biological Abstracts, Inc.

ENVIRONMENTAL REQUIREMENTS AND POLLUTION TOLERANCE OF FRESHWATER DIATOMS,
Bowling Green State Univ., Ohio.
R. L. Lowe.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency Cincinnati, Ohio, Report EPA-670/4-74-005, p 334, November 1974. 16 ref, 3 append. 1BA027 ROAP 05AEF; Task 12, R-802495.

Descriptors: Aquatic biology, Plankton, *Diatoms, Ecology, Algae, Water quality, Phytoplankton, *Bioindicators, Periphyton, *Lethal limit, *Water pollution effects.
Identifiers: Pollution tolerance, Algal ecology.

Data on the environmental requirements and pollution tolerance of 300 common species and varieties of fresh water diatoms were compiled from 48 references. The following parameters were considered: pH, nutrients, salinity, organic pollution tolerance (saprobien system), current, general habitat, specific habitat, seasonal distribution, temperature and geographical distribution. A consensus of opinions for each parameter was established for most taxa. It is suggested that this compilation be employed to evaluate data from plankton and periphyton samples collected for the assessment of water quality. (See also W71-04210) (EPA)

SALMONELLA AND NATURAL PURIFICATION OF POLLUTED WATERS, (IN GERMAN),
L. Popp.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. Vol 158, No 5, p 432-445. 1974 Illus.
Identifiers: Effluents, Fish, *Germany(Oker River), Infections, Rivers, *Salmonella, *Sewage treatment, Water purification, Water pollution effects, E. coli, *Self purification.

Along the river Oker (West Germany) a chain of control stations for water quality were instituted. All water samples were examined for the presence of salmonellae, for the number of Escherichia coli and for chemical data. An 18 mo. examination period is given, based on investigation of 826 water samples from the control stations and of 86 effluent samples from biological sewage treatment plants discharging into the main river and its tributaries; 55 types of salmonellae were isolated. The effluents of sewage plants contained 36 types of salmonellae, of which 32 also were found in the river. Numbers of isolated types of salmonellae and percentage of Salmonella-containing samples, the number of E. coli, the BOD and the flow volume at the control stations were recorded. Analogous data for effluents of sewage plants were presented. The results demonstrated the seasonal variations of Salmonella pollution. Semiquantitative examination for salmonellae at this control station were recorded. In spite of biological treatment of sewage and a high degree of dilution of effluents from the sewage treatment plants, considerable pollution by salmonellae was established. Effects of self purification were only seen during summer. Increasing flow elevated the percentage of Salmonella-containing samples but decreasing flow did not reduce the percentage. Consequently dilution cannot be considered an influence on Salmonella pollution. No dependence on BOD was observed. The epidemiological consequences of river pollutions by salmonellae were discussed. Attention was called to observations demonstrating that 64% of fishes caught in a polluted river were infected by salmonellae. The necessity of a reform of sewage treatment and sewage disposal was stressed.--Copyright 1974, Biological Abstracts, Inc.

MERCURY IN FOOD: A SCIENTIFIC STATUS SUMMARY BY THE INSTITUTE OF FOOD TECHNOLOGISTS' EXPERT PANEL ON FOOD SAFETY AND NUTRITION,
Institute of Food Technologists, Chicago, Ill. Expert Panel on Food Safety and Nutrition.
J Food Sci. Vol 38, No 4, p 1-6. 1973.
Identifiers: Epidemiology, Fish, Human diseases, Industrial, *Mercury, Microorganism, *Nutrition, Panel, Pollution, Safety, *Food safety.

Since Hg is ubiquitous, everyone consumes trace amounts. It can be found in all food and water, with higher concentrations in foods grown in areas having higher concentrations of Hg in soil. The short-chain alkyl Hg compounds, methyl, dimethyl and ethyl Hg, are more toxic than elemental Hg, inorganic salts of Hg and the aryl Hg compounds. Since Hg is excreted in feces, sweat exhaled breath, and urine, a daily intake of 1.0 mg/day of elemental Hg or inorganic Hg salts appears safe. The USA Department of Labor established an allowable level of 0.1 mg elemental Hg vapor or inorganic salts of Hg and 0.01 mg alkyl Hg per m3 of air for industrial exposures. The average USA diet contains less than 1/50 this amount. Epidemiological studies in several locations of elevated Hg content show no cases of methyl Hg poisoning resulting from fish consumption in the USA. The Food and Drug Administration does not allow the sale of fish containing more than 0.5 ppm (0.5 mg/kg) of Hg, and the canned tuna industry now includes Hg content as 1 of their quality specifications. The naturally occurring element, Hg, does not appear to pose a toxic hazard in the USA food supply; and there is no evidence that alkyl Hg formed by microorganisms in nature has led to methyl Hg poisoning. This does not imply there is no reason to control the release of elemental Hg and inorganic Hg salts into the environment from industrial operations. It does not indicate the problem has been recognized. Steps were taken to reduce discharges of elemental Hg and inorganic salts of Hg and to reduce or eliminate use of mercurials in agriculture providing an increasing margin of safety against the possibility of an excessive amount of Hg in any form finding its way into any portion of the USA food supply.--Copyright 1974, Biological Abstracts, Inc.

NUTRIENT ENRICHMENT OF GROUNDWATER FROM SEPTIC TANK DISPOSAL SYSTEMS,
Wisconsion Univ., Madison. Dept. of Geology and Geophysics.
J. G. Dudley, and D. A. Stephenson.
An Inland Lake Renewal and Shoreland Management Demonstration Project Report. November 1973. 131 p, 22 fig, 8 tab, 42 ref, 2 append.

Descriptors: *Ammonia, Nutrients, *Septic tanks, Water pollution sources, *Eutrophication, *Nitrogen compounds, *Phosphorus, Quality control, *Ground water, Recharge, Lake shores, Effluents, Sewage disposal, Nitrates, Lakes, Soils, Saturated flow.

Results of a literature review and field investigation of eleven septic systems of year-round dwellings near or on lakeshores document nutrient contributions of household septic disposal systems to ground water. Accumulations of nitrogen, ammonia, phosphorus, potassium and chloride were recorded. These varied with type of soils and water tables. Artificial recharge below absorption fields may result in local reversals of water table gradients and alterations in ground water flow patterns. In shoreland environments where under natural conditions lake water recharges the ground water, a local reversal could occur which would result in nutrient enriched ground water discharging to the lake. Large amounts of phosphorus may reach ground water at sites with well-drained, sandy soils where there is as much as 10 to 15 feet of unsaturated soil between the point of effluent release and the water table. Ground water samples taken with a bailer may have significant analytical bias. Proper location of observation wells is essential to ensure efficient monitoring of ground water quality. Additional research is needed to determine soil environmental factors which influence phosphorus migration and what physical and chemical transformations nitrogen species undergo in discharge areas. On lake shores where septic tank effluents may percolate into ground water which discharges to the lake large concentrations of phosphorus and nitrogen in nitrate form will promote large crops of algae and other aquatic plants. (Salzman-North Carolina)

THE EFFECTS OF THE INTERACTION OF OUTBOARD MOTORS WITH THE AQUATIC ENVIRONMENT: A REVIEW,
Southeastern Massachusetts Univ., North Dartmouth. Dept. of Civil Engineering.
T. P. Jackivicz, Jr., and L. N. Kuzminski.
Environ Res. Vol 6 No 4. p 436-454. Illus. 1973.
Identifiers: *Aquatic environment, Bluegill, Fathead minnows, Fish, *Motors(Outboard), Reproduction, *Reviews, Toxicity, *Water pollution effects, Biota.

The effects of the compounds associated with outboard motor subsurface exhausts on water quality and aquatic biota are reviewed. The problems affiliated with water quality may include the formation of undesirable tastes and odors and the appearance of oily substances. Outboard motor exhaust water can exhibit a toxic effect in sufficiently high concentrations to fathead minnows and bluegills, taints the flesh of various fish, and may affect the reproduction of fish. A discussion of the current research related to the effects of outboard motors on the aquatic environment is presented. Recommendations are given for future research to broaden the understanding of the interaction of outboard motors with the aquatic environment.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS OF POLLUTION ON FRESHWATER FISH, (LITERATURE REVIEW),
National Water Quality Lab., Duluth, Minn.
J. M. McKim, G. M. Christensen, J. H. Tucker, D. A. Benoit, and M. J. Lewis.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1540-1590, June, 1974. 399 ref.

Descriptors: *Reviews, *Bibliography, *Biochemistry, *Water pollution effects, *Fish, Thermal pollution, Monitoring, Bioassay, Mercury, Tritium, Aquatic environments, Pesticides, Water quality, Methodology, Salinity, Herbicides, Industrial pollution, Piscicides, Pulp wastes, Domestic pollution.
Identifiers: Enforcement, Organochloride pesticides, Organophosphates, Cholinesterase, Alpha-Beta endosulfan.

Many books dealing with biological indicators, biochemical ecology, water quality, and management were published between 1972 and 1973. One treatise contained articles on thermal pollution, monitoring, and enforcement. Papers on various bioassay methods and water chemistry problems were compiled by Glass. The American Society for Testing and Materials listed 140 new biological and chemical methods. Instrumental analysis, automated chemical analysis, and data analysis were investigated. Mercury contamination of the environment dealing with occurrence, methods of analysis, environmental dynamics, and biological effects was studied by Hartung, Friberg and Vostal. Occurrence, dynamics, methods of minimizing persistent pesticides, and international control of such pesticides was researched by Edwards. The biological and environmental aspects of chlorinated insecticides, dealing with biochemistry and toxicity to nontarget organisms was explored by Brooks. The effects of pesticides on aquatic environments was the subject of several reviews, including those of McCaull, Pimentel, Mawdesley-Thomas and Fraser. (Leibowitz-FIRL)

5D. Waste Treatment Processes

CONTROL STRATEGY DEVELOPMENT STUDY, SAN FRANCISCO WASTEWATER MASTER PLAN,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
H. G. Wenzel, and B. H. Bradford.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 332, $5.75 in paper copy, $2.25 in microfiche. Metropolitan Water Intelligence Systems Report, July 1974. 138 p, 15 fig, 12 tab, 10 ref, 5 append. OWRT C-4172(No 9028).

Descriptors: *Combined sewers, Simulation analysis, *Control systems, *Sewers, *Storm runoff, *Overflow, *Optimization, Water pollution control, Operations research, Storage, Detention, Reservoir operation, Mathematical models, Algorithms, Systems engineering, Automatic contro., Computer programs.
Identifiers: Combined sewer systems, *Mathematical programming.

Using the 1971 San Francisco Master Plan for Wastewater Management as a data source, this report demonstrates the use of simulation and optimization to develop a control strategy for combined sewer detention basins operating under computer based automatic control. Results are presented which can be applied for the implementation of control strategy at the subbasin level. A basin in southwest San Francisco is used to demonstrate the operation of the strategy for real time control. A substantial amount of short term rainfall data as well as several computer programs, are included.

RETRIEVABLE SURFACE STORAGE FACILITY, ALTERNATIVE CONCEPTS ENGINEERING STUDIES.
Atlantic Richfield Hanford Co., Richland, Wash.
Available from NTIS, Springfield, Va 22161 as Rept. No. ARH-2888, $7.60 in paper copy, $2.25 in microfiche. Report No. ARH-2888 Rev., July 1974. 287 p, 75 fig, 35 tab, append. AEC AT(45-1)-2130.

Descriptors: *Waste storage, *Alternative water use, *Radioactivity, *Radioactive waste disposal, *Air pollution, *Water pollution, Nuclear powerplants, Fuels, Forecast, Prediction, Monitoring, Solid wastes, Heat transfer, Safety, Evaluation, Assessment, Public health, Environmental effects, Design criteria, Cooling, Convection.
Identifiers: *Fuel reprocessing.

The company is performing engineering studies under the Atomic Energy Commission's direction that will lead to the construction of a Retrievable Surface Storage Facility (RSSF), capable of receiving all high-level radioactive wastes generated by the commercial reactor fuel reprocessing plants through the year 2000 and storing these wastes under continued surveillance and maintenance. A period of 100 years is used as a design basis. The RSSF is assumed to be capable of receiving and storing approximately 75,000 canisters (1 foot diameter by 10 feet long) of dry solid waste containing a total of about 200 megawatts of heat. The functional requirements for the RSSF are the storage of these wastes in a safe manner that will (1) protect the health and safety of the public, and (2) have minimum adverse impact on man's environment. General design criteria have been developed and three basic storage concepts studied to provide a basis for choosing a preferred concept for the RSSF. These concepts are (1) storage in water basins, (2) storage in air-cooled vaults, and (3) storage in rugged, thick-wall casks. (Houser-ORNL)
W75-04401

HIGH-LEVEL RADIOACTIVE WASTE MANAGEMENT ALTERNATIVES.
Battelle-Pacific Northwest Labs., Richland, Wash.
Available from NTIS, Springfield, Va 22161 as BNWL-1900, Vol. 1, 2, 3, and 4, $10.60 in paper copy, $2.25 in microfiche. Report No. BNWL-1900, May 1974. 4 volumes, 1367 p, 275 fig, 165 tab, 826 ref, 40 append. Edited by K. J. Schneider and A. M. Platt.

Descriptors: *Alternative planning, Wastes, *Management, *Radioactive waste disposal, *Waste dilution, *Waste disposal, Waste disposal wells, Waste dumps, Waste identification, Waste storage, *Waste treatment, Regulation, Public health, Research and development, Nuclear energy, Alternative planning, Methodology.
Identifiers: *High-level wastes, Partitioning, Extraterrestrial, *Transmutations.

A comprehensive overview study is presented of potential alternative methods for long-term management of high-level radioactive wastes. The study includes a compilation of information relevant to technical feasibility, safety, cost, environmental considerations, policy conflicts, public response and research and development needs for: (1) Disposal in terrestrial locations -- In geologic settings on land; in the seabed; in ice sheets. (2) Disposal into space. (3) Elimination by transmutation. The study is limited to the management of high-level radioactive waste from nuclear power by variations of these alternatives. Disposal of waste in bedded salt deposits was studied extensively in other AEC programs, and the concept is included here as part of the overall matrix of geologic disposal techniques. To complement these studies, investigations were also conducted on waste partitioning, and systems methodology was developed to assess the effects of radionuclides from waste introduced into man's ecological cycle, assuming some failure of the primary waste containment. IGH-LEVEL RADIOACTIVE WASTE ANAGEMENT ALTERNATIVES - SECTION 5: CE SHEET DISPOSAL,
attelle-Pacific Northwest Labs., Richland, ash.
. D. Tillson, R. W. Wallace, J. R. Divine, and W. Swift.
vailable from NTIS, Springfield, Va 22161 as ept. No. BNWL-1900, Vol. 3, $7.60 in paper opy, $2.25 in microfiche. In: Report No. BNWL-00, Vol. 3, May 1974. 199 p, 83 fig, 7 tab, 186 ref, ppend.

escriptors: *Alternative planning, Wastes, adioactivity, *Management, *Radioactive aste disposal, *Waste storage, *Transportation, ce, Sea ice, Firn, Ice jams, Melt water, Boats, ips, Transfer, *Waste treatment, Sites, echnology, Geology, *Antarctic, Arctic.
entifiers: Antarctica, *Greenland, Waste hanng.

e concept for disposal of high-level radioactive aste in ice sheets, either Antarctica or Greenid, has been described previously in the literare. A copy of one of the latest proposals has en included as Appendix 5A. For this study a neralized schematic of the operations that would required for waste management in ice sheets is own. The basic operations consists of truck, rail barge transport of solidified waste from a fuel rocessing plant or interim retrievable surface rage facility to specialized embarkation ports; rine transport during 1 to 3 months of each year specially designed ship, with ice-breaker corts near the ice sheet; off-loading of the waste nisters at a debarkation facility near the edge of continent; over-ice transport by surface vehis on a year-round basis; and off-loading and placement at the disposal site. Disposal of the gh-level waste would be by one of three conpts described as follows: (1) meltdown or free w; (2) anchored emplacement; and (3) surface rage. (See also W75-04402) (Hourse-ORNL)

scriptors: *Alternative planning, Waste treatnt, *Radioactive waste disposal, *Oceans, *Management, *Oceanography, *Marine geology, Sites, Sedimentation, Sedimentation rates, Sedimentary rocks, Environment, Safety, Solids, Transportation, Ships, Geology.
Identifiers: Seabed, Burial.

Some high-level radioactive wastes are managed by a system which features disposal in the seabed, generally in the deeper areas of the oceans. The various seabed areas studied were selected as representative of seabed areas which appear to have potential for long-term isolation of wastes. These areas include subduction zones--deep sea trenches, stable deep sea floor areas, and areas of relatively high sedimentation rates. In all cases, the waste is emplaced in the basement rock below the sediments to take advantage of remoteness from man, isolation from man's environment and high ion-exchange capacity of the sediments as backup protection. The management of the waste by these concepts consists of collection of previously solidified and canned wastes at specialized embarkation ports, transport by suitable ships to the seabed site and waste emplacement at the site from either a drilling ship or a semisubmersible drilling platform. Disposal is accomplished by the emplacement within the basement rock, and isolation is maintained by natural behavior within oceanic crustal layers after sealing of access/emplacement drill holes, or, in one concept, by further natural burial as a result of the geologic nature of the site. HIGH-LEVEL RADIOACTIVE WASTE MANAGEMENT ALTERNATIVES - SECTION 7: WASTE PARTITIONING,
Battelle-Pacific Northwest Labs., Richland, Wash.
J. W. Bartlett, R. E. Burns, L. A. Bray, L. L. Burger, and J. L. Ryan.
Available from NTIS, Springfield, Va 22161 as Rept. No. BNWL-1900, Vol. 4, $10.60 in paper copy, $2.25 in microfiche. In: Report No. BNWL-1900, Vol. 4, May 1974. 37 p, 3 fig, 1 tab, 14 ref.

Descriptors: *Radioactive waste disposal, *Management, *Alternative planning, Research and development, Radioisotopes, Degredation, Toxicity, *Waste storage, *Waste treatment.
Identifiers: *Waste partitioning.

An alternative approach in managing high-level radioactive waste involves separating the total waste into fractions of different half-lives. Short-lived fractions would then decay to become radioactively non-toxic in relatively short-times--times short enough to be within man's ability to control the waste storage. Long-lived fractions--significantly reduced in mass, volume and radioactive decay heat output--could be considered for other treatment, e.g., transmutation to non-radioactive or short-lived nuclides, extraterrestrial disposal, or special terrestrial disposal. (See also W75-04402) (Houser-ORNL)
W75-04407

HIGH-LEVEL RADIOACTIVITY WASTE MANAGEMENT ALTERNATIVES - SECTION 8: EXTRATERRESTRII DISPOSAL,
Battelle-Pacific Northwest Labs., Richland, Wash.
K. Drumheller, C. L. Brown, B. Griggs, R. E. Hyland, and J. S. Mackay.
Available from NTIS, Springfield, Va 22161 as Rept. No. BNWL-1900, Vol. 4, $10.60 in paper copy, $2.25 in microfiche. In: Report No. BNWL-1900, Vol. 4, May 1974. 204 p, 51 fig, 30 tab, 126 ref, 6 append.

Descriptors: *Alternative planning, *Radioactive waste disposal, *Waste treatment, *Transportation, Technology, Research and development, Solid wastes, Distance.
Identifiers: High-earth orbit, Spacecraft, *Extraterrestrial, Solar system escape, Encapsulation.

The basic concept of extraterrestrial disposal includes packaging waste materials in a safe manner and transporting the material by rocket or other means to a location off the earth. Several different trajectories have been considered. These include: (1) A high earth orbit on the order of 150,000 kilometers. (2) Transport to the sun. (3) A solar orbit other than that of the earth and planets. (4) Solar system escape. Vehicles used in the analysis as current technology include existing space vehicles and the planned space shuttle and tugs. (See also W75-04402) (Houser-ORNL)
W75-04408

HIGH-LEVEL RADIOACTIVE WASTE MANAGEMENT ALTERNATIVES - SECTION 9: TRANSMUTATION PROCESSING,
Battelle-Pacific Northwest Labs., Richland, Wash.
R. C. Liikala, J. B. Burnham, B. F. Gore, B. R. Leanord, Jr., and D. L. Lessor.
Available from NTIS, Springfield, Va 22161 as Rept. No. BNWL-1900, Vol. 4, $10.60 in paper copy, $2.25 in microfiche. In: Report No. BNWL-1900, Vol. 4, May 1974. 151 p, 22 fig, 35 tab, 78 ref, 5 append.

Descriptors: *Alternative planning, *Radioactive waste disposal, *Management, *Waste treatment, *Separation techniques, Radioisotopes, Toxicity, Toxins, Technology, Research and development, Nuclear explosions.
Identifiers: *Transmutation, Stable element, Reactor fission, Photon processes, Reactor fusion.

A possible approach to the management of radioactive waste is the use of nuclear processes themselves to change (transmute) the toxic long-lived radioactive constituents in high-level waste into short-lived radioactive or nonradioactive isotopes. Known processes which could potentially be used for transmuting toxic isotopes into nontoxic isotopes are described. The study is extensive enough to determine which fundamental processes are theoretically not possible in light of current technology. At the same time the study was not exhaustive in that little or no optimization of possible processes was attempted. Thus, initial conclusions of technical and/or economic infeasibility of transmutation should not dismiss future research entirely since it is the only method that has the potential for accelerating natural aging processes of eliminating waste. W75-04409

BIODEGRADABILITY OF A CARBOXYMETHYLOXYSUCCINATE DETERGENT BUILDER,
California Univ., Berkeley. Sanitary Engineering Research Lab.
S. A. Klein, and D. Jenkins.
Journal Water Pollution Control Federation, Vol 46, No 9, p 2107-2117, September, 1974. 10 fig, 4 tab, 7 ref.

Descriptors: *Detergents, Degradation(Decomposition), *Septic tanks, *Percolation, *Biological treatment, *Waste water treatment, Oxidation lagoons, *Biodegradation.
Identifiers: *Trisodium carboxymethyloxysuccinate.

Trisodium carboxymethyloxysuccinate (CMOS) is being used as a detergent builder that contains no phosphorus or nitrogen. The fate of CMOS during wastewater treatment by pilot scale septic tank-percolation field systems and oxidation ponds is discussed. Septic tanks with a two-day residence time are ineffective in removing CMOS; 10 percent CMOS removal was achieved by the septic tanks. CMOS degradation was essentially total in

aerobic percolation fields following septic tank treatment. CMOS degradation in excess of 90 percent was obtained in anaerobic percolation fields. The removal of CMOS is virtually complete when the dissolved oxygen of the percolation field effluent is one mg/liter. Algal oxidation ponds required an acclimation period of 150 days (about five times average hydraulic residence times) before significant CMOS removal occurred. The ponds receiving 30 mg/liter CMOS acclimated to CMOS slower and achieved lower levels of CMOS removal than ponds receiving CMOS levels of 15 mg/liter. (Orr-FIRL)
W75-04426

TRICKLING FILTRATION OF A WASTE CONTAINING NTA,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. L. Cleasby, D. W. Hubly, T. A. Ladd, and E. A. Schon.
Journal Water Pollution Control Federation, Vol 46, No 8, p 1873-1887, August, 1974. 8 fig, 4 tab, 20 ref.

Descriptors: *Trickling filters, *Nitrilotriacetic acid, *Detergents, Biochemical oxygen demand, Chemical oxygen demand, Nitrification, Heavy metals, *Waste water treatment, Filtration.

Interest is being shown in the use of the soidum salt of nitrilotraicetic acid (NTA) as a replacement compound for polyphosphate detergent builders. However, before NTA can be allowed to replace phosphates in the environment its ultimate fate as it goes through the waterways and waste treatment plants must be known. The effect of NTA on a trickling filter and the NTA-removal ability of the trickling filter are discussed. There was no effect on the efficiency of a trickling filter to remove BOD, COD, and TOC at NTA levels of 4, 8, and 16 mg/liter. Two to three weeks were needed at an NTA feed level of 4 mg/liter before substantially complete NTA removal occurred. NTA levels of less than 0.5 mg/liter were consistently reached at dosage levels of 4 and 8 mg/liter Na3NTA during the summer and fall. During cold weather operation, the NTA removal was less complete (less than 2 mg/liter in the effluent when the NTA level was 8 mg/liter). No functional relationships between NTA removal and the removal of other organic substances were observed. The NTA had no effect on nitrification efficiency or on the ability of the trickling filter to remove heavy metals. (Orr-FIRL)
W75-04427

FLUIDIZED-BED SLUDGE INCINERATOR DESIGN,
Kramer, Chin and Mayo, Seattle, Wash.
P. B. Liao.
Journal Water Pollution Control Federation, Vol 4, No 8, p 1895-1913, August, 1974. 6 fig, 3 tab, 22 ref.

Descriptors: *Sludge disposal, *Waste water treatment, *Incineration, Design, Ultimate disposal, Design criteria, *Pilot plants, Burning, Facilities.

Theories of fluidization and sludge combusion, methods for development of design criteria, equations, and procedures for design calculations for a fluidized-bed wastewater sludge incinerator are discussed. The design criteria and equations derived are the result of pilot plant operation. They can be used for prototype incinerator design. A design method is given which ranges from determining the amount and rate of sludge to be incinerated to determining the best air pollution control equipment. An incinerator can be designed by using the equations and the relationships between sludge loadings, air supply, and fuel requirements. Fluidized-bed treatment is a sanitary and efficient method of wastewater sludge disposal and has a minimum of detrimental effects on the environment. (Orr-FIRL)
W75-04428

GRANULAR FILTERS FOR TERTIARY WASTEWATER TREATMENT,
Iowa State Univ., Ames.
E. R. Baumann, and J. Y. C. Huang.
Journal Water Pollution Control Federation, Vol 46, No 8, p 1958-1973, August, 1974. 14 fig, 3 tab, 24 ref.

Descriptors: *Filters, *Filtration, *Tertiary treatment, Design criteria, *Pilot plants, Suspended solids, *Waste water treatment, *Iowa.
Identifiers: Dual-media filter.

A dual-media filter (coarse anthracite over finer sand) overcomes the problems of head loss across the filter and no penetration of the solids into the bed that are present when a normal, graded, single-medium filter is used to filter the suspended solids left after secondary treatment. A pilot plant was constructed and operated at the Ames, Iowa, Pollution Control Plant to test procedures to be used in the design of tertiary wastewater filters and to determine the effectiveness of granular filtration in reducing the pollution potential of the effluent from a water pollution control plant. The results showed that the final effluent from the control plant should be filtered through a dual-media filter with 38.10 cm of uni-sized 1.84 mm anthracite on top of 38.10 cm of uni-sized 0.55 mm sand. The filtrate suspended solids should be about 4 to 5 mg/liter, the filtration rate can be as high as 6 gpm/sq ft, and the influent suspended solids can be as high as 40 mg/liter. The following steps should be included in a design of a pilot plant operation to determine the optimum economic design of a tertiary filter plant: determination of the proper size and depth of anthracite and sand based on the particular type of wastewater; determination of the backwash rate required for the chosen media size and depth combination; development of curves relating the net water production to the filtration rate under different run lengths; and, development of the curves relating run length to the filtration rate at different suspended solids concentration. ELECTROCHEMICAL PROCESS FOR NUTRIENT REMOVAL,
Rhode Island Univ., Kingston. Dept. of Civil and Environmental Engineering.
C. P. C. Poon.
Available from the National Technical Information Service., Springfield, Va. 22161, as PB 239 415, $3.75 paper copy, $2.25 microfiche. Completion Report, (1974). 42 p. 10 fig, 7 tab, 8 ref.OWRT A-040-RI(2), 14-31-0001-3840.

Descriptors: *Waste water treatment, *Adsorption, Electrochemistry, *Chlorination, *Phosphates, Kinetics, Stratification, *Nitrogen, *Nutrient removal, Coliforms, Biochemical oxygen demand, Model studies.

A flow-through electrochemical process can be used for municipal or industrial wastewater treatment where seawater is easily accessible and ocean discharge of effluent (better than secondary effluent quality) is permitted. Because of its simplicity in construction and operation, the process is seen as a most promising candidate of future shipboard waste treatment for vessels of various sizes operating on saline water. The primary mechanism for phosphorous removal in the electrochemical process was adsorption onto Mg (OH)2 flocs; the adsorption process followed a Langmuir type isotherm kinetic. Breakpoint chlorination was primarily responsible for nitrogen removal from sewage. If there was a good stratification in a batch process and when the power supply was 4.5 kwh/1000 gallons of sewage, the process could remove in 60 minutes the following: P - 98%, N - 85%, BOD - 85%, SS-87% and Coliform - 100%. Tests using a flow-through model showed that efficiency of nutrients removal was improved significantly by increasing the sewage-seawater ratio.

NITROGEN MASS BALANCE DETERMINATION FOR SIMULATED WASTEWATER LAND-SPREADING OPERATIONS,
Texas Tech Univ., Lubbock. Water Resources Center.
R. M. Sweazy, S. W. Chapman, Jr., and D. M. Wells.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 406, $4.25 paper copy, $2.25 microfiche. Completion Report, December 1974. 44 p, 5 fig, 13 tab, 17 ref. OWRT A-026-TEX(1).

Descriptors: Texas, *Water reuse, Soils, Irrigation, *Sewage effluent, Nitrates, Nitrification, Nitrogen, Percolation, Groundwater, Water quality, Absorption.
Identifiers: *Nitrogen Mass Balance, Nitrogen Uptake, Sewage Farming, *Lubbock(TEX).

Treated sewage effluent from the City of Lubbock was applied to three soil bins filled with typical West Texas soil. The effluent added and the percolated effluent were analyzed to determine the various forms of nitrogen so that a mass balance could be determined, and the nitrate pollution potential of secondary effluent used for irrigation on the South Plains of Texas could be evaluated. The amount of effluent applied was approximately that applied in normal irrigation projects using secondary wastewaters. Results showed that irrigation with sewage effluent on the High Plains of Texas is a source of groundwater pollution. Selective crop production was determined to be the most effective method of protecting the groundwater from sewage irrigation provided loading rates are such that nitrogen uptake by the crop approximates the nitrogen applied in the sewage effluent.

APPARATUS FOR THE FILTRATION AND BIOLOGICAL PURIFICATION OF CONTAMINATED WATER,
A. Schreiber, E. Schreiber, and B. Schreiber.

U.S. Patent No 3,846,305, 6 p, 13 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 266, November 5, 1974.

Descriptors: *Patents, *Waste water treatment, *Filters, *Filtration, Water quality control, Pollution abatement, *Biological treatment, Water pollution, *Trickling filters.

An apparatus for the filtration and biological purification of contaminated water is disclosed. The apparatus has a trickling filter tank containing a wear-resisting filler material having a specific gravity of not greater than 1. The filler material is filled with flusing water for the purpose of freeing it. The mixture of filler material, sludge, water and additionally supplied flusing water, is displaced by agitation to discharge the greater part of the sludge in the form of a mixture of water and sludge. The flushing water mixed with sludge is thereafter discharged and the trickling filter tank is once again fed with contaminated water to be purified. (Sinha-OEIS)
W75-04454

SEWAGE TREATMENT SYSTEM,
G. A. Milne.
U.S. Patent No 3,859,215, 5 p, 3 fig, 17 ref; Official Gazette of the United States Patent Office, Vol 930, No 1, p 434, January 7, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Domestic wastes, *Aeration, Pollution abatement, Water pollution control, Underground structures, Sludge, Equipment.
Identifiers: Clarification, Tertiary treatment.

A sewage aeration tank is constructed as an elongated cylinder with a horizontal axis having a length to diameter ratio of greater than three to one. The large areation tank is completely closed and has openings tightly surrounding sewage inlet and effluent pipes, sludge return pipes, oxygenation pipes and vent pipes. The large aeration tank and its sewage inlet, grease and trash trap, clarifier, sludge return lines from the clarifier to the aeration tank, tertiary treatment tank and outflow apparatus are buried underground. A recreational space is provided on top of the system. An air blower is housed in an equipment room of an adjacent apartment unit which the system serves, and a vent extends upward from a roof of the apartment house. (Sinha-OEIS)
W75-04456

WATER CLARIFICATION WITH NITROGEN-HETEROCYCLIC PHOSPHONIC ACIDS,
Petrolite Corp., Wilmington, Del. (assignee).
D. Redmore.
U. S. Patent No 3,859,211, 15 p, 6 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 930, No 1, p 432, January 7, 1975.

Descriptors: *Patents, *Waste water treatment, *Flocculation, Suspended solids, Corrosion control, Scaling, Aggregates.
Identifiers: *Chemical treatment, *Water clarification, Nitrogen heterocyclic phosphonic acids.

A process is disclosed for clarification of water by adding to water containing suspended matter, nitrogen heterocyclic phosphonic acids and derivatives. T They are characterized by aminomethyl (Or substituted methyl) phosphonic acids or derivatives thereof bonded directly or indirectly, i.e., through a N-side chain to the nigrogen atom in the heterocyclic ring. The addition of the compounds of this invention to the water suspension should be made in such a fashion that the resulting flocculation and aggregation of the particles takes place uniformly throughout the body of water. (Sinha-OEIS)
W75-04457

RECOVERY OF POTABLE WATER FROM SANITARY WASTE USING SOLID WASTES AND REFUSE AS A HEAT SOURCE,
F. W. Taylor.
U.S. Patent No 3,859,174, 7 p, 4 fig, 15 ref; Official Gazette of the United States Patent Office, Vol 930, No 1, p 421, January 7, 1975.

Descriptors: *Patents, Solid wastes, *Potable water, *Waste water treatment, *Evaporation, *Condensation, Water supply, Water purification, *Municipal water, Incineration, Heat exchanger, Gases, Water vapor.
Identifiers: *Sanitary wastes.

A process and apparatus for disposing of solid wastes, for disposing of sanitary waste waters, and for producing potable water, are disclosed. The solid wastes are incinerated and the heat generated during incineration is used to evaporate sanitary waste waters. Contaminated waters are first used as cooling water and then atomized into the gas stream coming from the incinerator to cool the combustion gases and evaporate the water in the contaminated water. Solids are removed from the gas stream, which also contains water vapors, and then the gases are cooled to condense the water vapors, which is suitable for use in a city water supply system. SELF-RECONDITIONING FILTER APPARATUS FOR CONTINUOUS REMOVAL OF SOLIDS FROM A STREAM OF LIQUID,
T. Hagihara.
U.S. Patent No3,856,678, 5 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1701, December 24, 1974.

Descriptors: *Patents, *Filters, *Filtration, *Solid wastes, *Waste water treatment, Pollution abatement, Water pollution control, Sea water, Industrial wastes, Equipment.
Identifiers: Self-reconditioning filters, Endless belts.

An imporved filter apparatus is capable of continuously arresting solids of various size and nature contained in a liquid flowing through a channel of given width and depth, carrying the arrested solids away from the flow of liquid and succeedingly casting them off. The filter apparatus includes a pair of toothed wheels mounted adjacent both ends of a shaft which is rotatably supported across the desired liquid channel adjacent its bottom. A second pair of toothed wheels similarly mounted on a second shaft are placed on the downstream side of the first shaft. A third pair of toothed wheels can likewise be mounted on a third shaft further on the downstream side in coplanar relationship to the others. A filter medium in the form of a flexible endless belt operates over the pairs of toothed wheels. As the filter turns over the third pair of toothed wheels, the hook portions of the filter units are caused to swing outwardly thereby casting off the solids which have been caught by the filter medium. (Sinha-OEIS)
W75-04460

CLOSED-LOOP OZONE GENERATING AND CONTACTING SYSTEM,
Grace, W. R. and Co., New York. (assignee).
H. Lee, and H. M. Rosen.
U.S. Patent No 3,856,671, 6 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1699, December 24, 1974.

Descriptors: *Patents, *Water purification, *Ozone, Oxygen, Gases, Nitrogen, Carbon dioxide, Water vapor, Waste water treatment.
Identifiers: *Fractionators, Closed-loop, Ozonator.

Water can be treated with ozone and/or oxygen in a closed-loop cycle, thus conserving the high oxygen content gas. The system comprises as a principal feature a pressure-swing fractionator which removes nitrogen, carbon dioxide and water vapor from a feed gas, producing an oxygen enriched gas which flows to a contactor or an ozonator. The oxygen enriched gas from the ozonator contains from about 1 to 7 percent ozone. This gas mixture, or solely an oxygen stream, is then contacted with water to be treated. Purified water is recovered, and excess oxygen and/or oxygen and enriched in nitrogen, forms a recycle gas which is combined with a charge of air and flowed to the pressure-swing fractionator to begin another cycle. The pressure-swing fractionator serves the dual simultaneous purpose of producing the necessary oxygen enriched gas for subsequent use and maintaining a low nitrogen level throughout the closed-loop. (Sinha-OEIS)
W75-04461

REMOVAL OF BORON FROM WATER,
Occidental Petroleum Corp., Los Angeles, Calif. (assignee).
W. D. Peterson.
*Patents, *Boron, Water treatment, *Ion exchange, Pollution abatement, *Sewage treatment, *Waste water treatment, Water pollution control, Resins, Phenols, Cations, Alkalis(Bases), Nitrogen, Ammonium compounds.
Identifiers: *Chemical treatment, Aldehydes, Alkaline earths.

A process is described for the removal of boron values from aqueous solutions containing borate ions. The aqueous solution is contacted with a water insoluble solid organic ion exchange resin. The resin is produced by the co-condensation of an aromatic ortho hydroxy carboxylic acid, a phenolic compound and an aldehyde to selectively absorb the boron value onto the resin in the presence of at least one cationic species selected from the group consisting of alkali, alkaline earth, nitrogen organic bases and ammonium cations. The cationic species can be incorporated into the resin during resin formation, or they can be incorporated into the resin by contacting the resin with a solution containing the desired species prior to utilizing the resin in the process. (Sinha-OEIS)
W75-04462

METHOD FOR TREATMENT OF COAL WASHERY WATERS,
R. H. Shubert.
U.S. Patent No 3,856,668, 6 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1698, December 24, 1974.

Descriptors: *Patents, *Waste water treatment, *Coal mine wastes, *Filtration, *Mine wastes, Pollution abatement, Suspended solids, Clays, Shales.
Identifiers: *Black water, Hydrocarbon oil, Agglomerates.

Waters containing finely divided coal and inorganic matter, such as are produced as a waste in coal washery plants, may be clarified and substantially freed of suspended solids using a two-step process in which coal particles are removed in the first step and inorganic mineral constituents are removed in a second step. Coal is removed in the first step by agglomerating the coal to form relatively large flocs or clumps. The agglomerates float on water in spite of the fact that the specific gravity of coal is substantially greater than that of water. Agglomeration is accomplised by treating the black water waste with a heavy hydrocarbon oil while subjecting the mixture to agitation of suf-

ficient intensity to coat the coal particles and to cause collisions between coated coal particles. Filtration through a relatively coarse medium such as a fine screen retains the coal agglomerates as a cake while passing the water and suspended mineral constituents. The water fraction is further treated preferably by settling, to produce a water stream substantially free of suspended matter. Coal agglomerates removed from the separation zone display a relatively low ash content and high calorific value since they contain essentially all of the hydrocarbons used in theagglomeration. The agglomerates dewater readily and may be dried and used as fuel. (Sinha-OEIS)
W75-04463

METHOD FOR ELECTROSANITIZING WASTE WATER,
Diamond Shamrock Corp., Cleveland, Ohio. (assignee).
D. F. Lieb, and N. W. Stillman.
U.S. Patent No 3,856,642, 4 p, 2 fig, 2 tab, 7 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1690, December 24, 1974.

Descriptors: *Patents, *Waste water treatment, *Disinfection, *Oxidation, *Chlorination, Water pollution treatment, *Sewage treatment, Alkali metals, Equipment, Electrolysis, Suspended solids.
Identifiers: Electrosanitizing, Primary treatment, Secondary treatment.

A process for oxidizing and disinfecting waste water is accomplished by placing waste water containing an alkali metal chloride into a first container. The waste water is agitated and macerated so that any solids are comminuted. While agitating and macerating, the waste water is subjected to electrolysis whereby chlorine is produced. The waste water is then transferred to a second container where it is further agitated and finally removed as purified water. The process is performed in an apparatus which comprises a primary treatment container. The container has a combination agitator and macerator and an electrode pack containing at least one anode and cathode and is connected to a direct current source. A secondary treatment container has an agitator and an outlet for treated water. It may also contain an electrode pack. (Sinha-OEIS)
W75-04464

LIGNIN SEPARATION BY CONTINUOUS ION FLOTATION: INVESTIGATION OF PHYSICAL OPERATIONAL PARAMETERS,
Rutgers - the State Univ., New Brunswick, N.J.
M. H. Wang, M. L. Granstrom, T. E. Wilson, and L. K. Wang.
Water Resources Bulletin, Vol 10, No 2, p 283-294, April, 1974. 3 fig, 9 tab, 11 ref. OWRT A-022 NJ(4).

Descriptors: *Lignins, *Pulp wastes, *Flotation, *Water purification, Waste treatment, Water pollution treatment, *Operations research, Systems analysis, Separation techniques, Model studies, Foaming, *Waste water treatment, Foam separation, Water pollution sources, Ions, Surfactants.
Identifiers: Indulin C, *Ion flotation.

The removal of synthetic kraft lignin (Indulin C) from aqueous solution by a continuous ion flotation system was investigated. A feed solution of lignin (100 mg/liter) was treated with 50 mg of cetyldimethylbenzylammonium chloride/liter and passed downward through a plexiglas column (10.26 cm inside diameter) as air flowed upward. Lignin removal was 95% when the air flow was 2000 cu m/min, the feed rate was 100 cu m/min, and the lignin feed inlet was above the solution/foam interface. (Buchanan-IPC)

NOTES--WORKSHOP ON COMPUTER-AIDED DESIGN AND SIMULATION OF WASTE TREATMENT SYSTEMS,
Silveston (B and P), Kitchener (Ontario).
Training Manual EPS 6-WP-74-1. Water Pollution Control Directorate, Environmental Protection Service, Environment Canada, January 1974. 459 p, 127 fig, 38 tab, 176 ref, 2 append.

Descriptors: Computers, *Design, *Simulation analysis, *Waste water treatment, *Computer programs, *Computer models, *Model studies, Engineering, Management, Waste water (Pollution), Equations, Systems analysis, Optimization, Streams, Activated sludge, Trickling filters, Costs, Risks, Treatment facilities.
Identifiers: Clarifiers.

The potential for computer application to performance, planning and design studies of waste treatment systems is substantial. The rapid advance in software applications makes it possible to handle 'non routine' waste treatment systems almost as easily as 'routine' ones. Computer-aided design makes explicit allowance for uncertainty; design risks can be quantitized. Software packages are presented which overcome many of the problems usually associated with computer application to planning and design situations. These packages have been organized so that the judgement and experience of senior staff can be brought to bear on design or analysis problems almost as easily as they can using conventional engineering procedures. The software has been developed so that its use, and even modification, is not limited to computer specialists. Moreover, computer costs have become surprisingly reasonable. The types of programs discussed will require only 5 to 15 seconds of computing time/run (at a cost of $2 to $6). Considered herein are: the use of computers in process analysis and design; choice of design approach; process systems analysis; stream vectors; developing a model library; clarifier models; activated sludge systems; trickling filter models; digester models; preliminary treatment, chlorination and miscellaneous models; sludge treatment processes; and an executive program, SEPSIM, including its user's manual. Computer-aided procedures do a substantially better job at little extra cost. (Bell-Cornell)

MODELING SEWAGE TREATMENT PLANT INPUT BOD DATA,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
P. M. Berthouex, W. G. Hunter, L. C. Pallesen, and C. Y. Shih.
Journal of the Environmental Engineering Division, American Society of Civil Engineers. Vol 101, No EEI, Proceedings paper No 11132, p 127-138, February 1975. 5 fig, 2 tab, 6 ref.

Descriptors: *Sewage treatment, *Statistical methods, *Environmental engineering, *Biochemical oxygen demand, *Stochastic processes, *Time series analysis, *Input-output analysis, Water quality control, Methodology, Treatment facilities, Design, Forecasting, Mathematical models, Systems analysis, Equations.
Identifiers: System performance, Control methods, First-order autoregressive model, Influent data.

A wastewater treatment plant is a complex stochastic dynamic system. The first step toward the design of a control system is to model the stochastic system inputs and outputs. The basic shortcomings of deterministic models for studying a stochastic process are illustrated. The methodology developed by Box and Jenkins (1970) to model time series is used to characterize the field BOD data for a sewage treatment plant; basic stochastic models are given. A first-order autoregressive model is found to describe influent BOD data fairly well. Model-building is seen as an iterative process that is most efficiently done with simple models; only if the models prove inadequate should further complexities be introduced. Stochastic models often contain relatively few parameters and are simple to interpret and apply. Modeling system inputs and outputs is the first step in deriving stochastic dynamic transfer functions for the system. (Bell-Cornell)

DESIGN, CONSTRUCTION AND LAUNCHING OF A SUBMARINE OUTFALL SEWER AT WHITSTABLE,
Whitstable Urban District Council(England).
B. E. Hardy.
Journal of the Institution of Municipal Engineers, Vol 100, No 7, p 201-207, July 1973. 5 fig, 2 tab, 10 ref.

Descriptors: *Environmental engineering, *Sewage disposal, *Outfall sewers, *Design, *Construction, *Pipelines, *Water pollution control, *Public health, Standards, Technology, Oceans, Coasts, Submarines, Domestic wastes, Industrial wastes, Fisheries, Effluents, Toxicity, Currents(Water), Economic efficiency, Waste treatment, Costs, Hydrographs, Dilution, Diffusion, Equations.
Identifiers: Whitstable(North Kent-England), Tidal estuaries, Launching.

Extremely large amounts of domestic sewage and industrial wastes are discharged daily along the eastern and southern coasts of England. The municipal engineer, who must consider whether to dispose of his town's sewage to sea after only partial treatment, is obliged to investigate public health, amenity, and fishery conditions as well as the strictly technical investigations of currents, the sea bed, flow, and design criteria. Problems of sea outfall design are discussed considering the technical aspects and public health philosophy of disposal of partially treated sewage to the sea by means of a long outfall. Considered also is engineering design in the construction of an outfall. Data are reported, including details referring to the outfall at Whitstable on the North Kent coast, in order to assist those who must solve similar problems in coastal waters and tidal estuaries. Discussed are the contract, the design of the pipeline, four basic methods of laying such pipeline, and the pipe launch itself. Given acceptance of and compliance with the present philosophy of public health and other standards required, then disposal of partially-treated domestic sewage to coastal waters is an economic and satisfactory method of disposal and can produce substantial total annual savings to a local authority. The problem, however, is complicated and opinions may change as fresh scientific data are evaluated. (Bell-Cornell)

A PROTOTYPE SYSTEM TO RENOVATE AND RECYCLE SWINE WASTES HYDRAULICALLY,
Iowa State Univ., Ames.
R. J. Smith.
Ph.D. Dissertation, Department of Agricultural Engineering, Iowa State University, 1971, 176 p, 21 fig, 91 tab, 63 ref.

Descriptors: *Farm wastes, *Hogs, *Recycling, Hydraulics, *Waste water treatment, Lagoons, Anaerobic conditions, *Oxidation lagoons, Sludge, Effluent, Biochemical oxygen demand, Nitrates, Phosphates, Chloride, *Water reuse.
Identifiers: *Oxidation ditch, Flush tank, Settling tank, Land application.

The objective was to determine the parcticality of a recycled effluent system for manure transport in swine finishing buildings. Manure handling was accomplished with a continuous flow gutter and latter with a flushing tank. Better pen cleanliness was accomplished with continuous flow and rapid flushes, but this method led to an increase in the

volume of manure slurry requiring treatment. Three treatment systems were observed: anaerobic lagoon and oxidation ditch, oxidation ditch alone and lagoon alone. The best quality returned effluent came from the anaerobic lagoon and oxidation ditch. It appears that effluent from any of the three treatment systems does not adversely affect pig performance. None of the three systems was capable of producing a final effluent suitable for discharge to a watercourse. Final disposal would ultimately have to be by land application. (Russell-East Central)
W75-04542

ECONOMIC AND ENVIRONMENTAL CONSIDERATIONS IN DAIRY MANURE MANAGEMENT SYSTEMS,
New York State Coll. of Agriculture and Life Sciences, Ithaca, N.Y. Dept. of Agricultural Economics.
J. J. Jacobs, and G. L. Casler.
Cornell University Agricultural Experiment Station Report A E Res 72-18, December, 1972, 31 p, 1 fig, 4 tab, 8 ref.

Descriptors: Economics, Environmental control, *Dairy industry, *Farm wastes, *Waste treatment, *Waste storage, *Waste disposal, Lagoons, *Water pollution control, Odor, Costs, Labor, Equipment, Research.
Identifiers: Questionnaires, Flies, Waste management system.

Results of the analysis suggest that almost any realistic alternative to daily spreading will increase the cost of manure handling on dairy farms, but will not necessarily decrease the environmental impacts. Preliminary attempts to measure and aggregate the environmental impact of alternative manure handling systems indicate that the difference among systems is not as great as that implied by those who have suggested that dairymen should be doing something other than daily spreading. Storage of lagoon systems are expensive and eventually result in adverse effects on the environment. This suggests further research must be done on the environmental effects of alternative manure handling systems before making overall recommendations on what is the appropriate system. (Russell-East Central)

COPROLOGY: A POLLUTION SOLUTION,
Ohio State Univ., Columbus.
T. P. Taiganides.
Agricultural Engineering, Vol 55, No 4, p 21, April 1974. 1 fig.

Descriptors: *Recycling, *Farm wastes, Sewage, Municipal wastes, Pollutants, Foods, Ecology, Methane, Gases, *Waste treatment, *Water reuse, Waste water treatment.
Identifiers: Coprology, *Waste management.

Coprology is defined as the science of waste management. The basic premise of coprology is that there is no such thing as waste. Everything is a resource. Research is being conducted to find new ways of recycling wastes. It is estimated that livestock wastes in the United States could be used to produce methane gas in sufficient quantities annually to meet a large part of our natural gas requirements. The potential value of manure-derived methane gas is over one billion dollars. Also, city waste refuse is being made into building blocks or into heat energy. City sewage is being used to increase productivity of land. In the future, the need for more food will drastically increase. With this increase will be a matched increase in waste production. The problems of waste management must be dealt with and controlled and future industrialization must not only be justified on economic and political terms, but also on ecological terms. (Russell-East Central)

FARMS ARE NOT IN THE COUNTRY ANY MORE,
New Jersey Agricultural Experiment Station, New Brunswick.
C. J. Teller.
Compost Science, Vol 11, No 1, p 8-9, January-February, 1970. 2 fig.

Descriptors: *Waste disposal, *Livestock, *Farms, *Farm wastes, Recycling, Aeration, *New Jersey, Research and development, Dairy industry, Hogs, Odor.
Identifiers: *Suburban areas, Land disposal, Composting, Soil conditioner, Plowing.

Dairy farms in New Jersey adjoin industrial parks and only the width of a highway separates a South Jersey hog farm from a new housing development. A series of projects is being carried out at the Rutgers College of Agriculture and Environmental Science concerning the problems of agricultural solid wastes in today's suburban society. A special 'Animal Waste Disposal Task Force' was organized with representatives from 23 local, State, and Federal public and private agencies and organizations interested in animal waste disposal. Environmental scientists, engineers, and soil chemists are studying the feasibility of incorporating manure into the soil. Equipment has been developed for making a furrow, placing manure in it, then covering the manure and opening another furrow all in the same operation. The feasibility of composting manure has also been investigated. The first trial is now under way utilizing a roto-shredder to aerate the windrows. It is not expected that composting will be a profit-making venture. Dairy and hog farmers may have to sell it at about half what it costs to make it in order to dispose of manure. The composition of odors and flavors is being studied and a project that will utilize fungi to convert carbohydrate waste into protein supplement is being considered. Walker-Gordon Farm in Plainsboro has been drying manure, mixing it with cocoa shells to deodorize it, and selling the mixture as a soil conditioner. (East Central State College)
W75-04546

FERTILITY,
Crops and Soils Magazine, Vol 25, No 1, p 28, October, 1972. 1 fig.

Descriptors: *Fertility, *Fertilizers, *Waste disposal, *Farm wastes, Economics, Cattle, Waste storage, Agriculture, Nitrogen, Phosphorus, Potassium, *Waste treatment.
Identifiers: Chemical fertilizers, Spreading.

Manure's cash value as a fertilizer is discussed. One cow will produce about 15 tons of manure per year which contains nitrogen, phosphorus, and potassium. If one purchased this much fertilizer commercially it would cost about $30. However, when manure is spread in the open almost any time of the year it will lose about a third of its original value. Spreading the manure in the winter will increase the losses. The main losses come from spreading, not storing, so it is best to plow the manure down as soon as possible after spreading. Therefore, the best method to use would be to store the manure all year and spread it just before fall plowing. (East Central State College)
W75-04550

INDIANA POULTRYMEN ARE COMPOSTING POULTRY MANURE,
Purdue Univ., Lafayette, Ind.
J. G. Berry.
Compost Science, Vol 12, No 1, p 4-5, January-February, 1971. 3 fig.

Descriptors: *Poultry, *Farm wastes, Costs, *Indiana, *Waste treatment, Odor, Waste storage, Ventilation, Aeration, Waste disposal.
Identifiers: *Composting, Flies, Deep-pit system.

Poultrymen in Indiana have found a method of composting poultry manure that reduces labor costs, and virtually eliminates fly and odor problems. Laying hens are housed in cages or on slats above pits in which the droppings are collected. If the pit is kept dry, there is no odor at all. One pit, in operation for 6 years, had a 34-in. deep compost, which was dry to a depth of 18 in., and moist below. This system is generally successful, and where problems occur, they are not as great as those resulting from handling manure by conventional methods. (East Central State College)
W75-04552

THE SOCIAL REDEMPTION OF PURE GARBAGE,
J. Solomon.
The Sciences, Vol 12, No 6, p 13-15, July-August 1972.

Descriptors: *Reclamation, *Waste treatment, *California, Anaerobic digestion, Methane, Fuels, Gasses, *Recycling.
Identifiers: *Garbage, Chlorine, Sulfur.

Possibilities for converting garbage into fuel are outlined. If garbage were efficiently converted to power, it could furnish up to 6 percent of total U.S. energy needs. Each pound of garbage can supply 3,000 to 6,000 Btu of heat. One company fed pulverized refuse into a power generating station. Waste provides 10 percent of the energy fired. In another process, solid waste is reduced in size and fed to a pressurized, fluidized bed combuster. Hot gasses are cleaned of particulates and passed through a gas turbine to produce electricity. In both cases, however, chlorine produced in the off-gasses is a potential pollutant. A corporation in California is attempting to produce oil, fuel gas, and solid char by exposing solid waste to iron removal processes, air classification, shredding, and pyrolysis. Another firm reacts solid waste with carbon monoxide in the presence of sodium carbonate to yield low-sulfur fuel. If all of the nation's animal waste were treated by anaerobic digestion, half of the current methane consumption would be produced. (East Central State College)
W75-04553

ENERGY NEEDED TO MANAGE ANIMAL WASTE.
Electrical World, Vol 178, No 5, p 70-72, September 1, 1972. 2 fig.

Descriptors: *Energy, *Farm wastes, *Management, *Recycling, *Waste treatment, *Waste disposal, Feed lots, Feeds, Drying, Spreading, Irrigation, Aeration, Oxidation lagoons.
Identifiers: Pyrolysis.

As the demand for some form of animal waste handling system grows, so will the demand for energy necessary to drive these systems. The most popular way of dealing with animal waste today is to incorporate air into liquid wastes. Processes of this type use aeration wheels, discs, or aeration pumps and are generally electrically powered. Floating aerators, sprinkling systems, and oxidation ditches require substantial amounts of energy since they typically use 3-hp motors for each aeration unit. Animal wastes can also be dried and sold; the market at present for dried manure is very good. This process too requires heat energy from some source, as does pyrolysis, a means by which manure has been successfully converted into a range of products including crude oil, natural gas, and treated manure. Recycling of animal wastes as feed for the beasts that produced the manure in the first place probably holds more potential than almost any other recent feeding discovery. The basic requirement for the conversion of manure to feed is heat to promote the thermophilic bacterial reaction involved. Another popular concept--returning the wastes to land--will

necessitate either electrical or internal-combustion power supplies to operate the sprinkler systems and pumps. (East Central State College)
W75-04554

PERPETUAL-MOTION RECYCLING, OR, PIG MANURE INTO FISH FOOD,
M. Franz.
Compost Science, Vol 12, No 5, p 21, September-October 1971. 1 fig.

Descriptors: *Recycling, *Farm wastes, Livestock, Hogs, Feeds, *Fish farming, *Fish diets, *Waste treatment.

A system has been proposed for recycling the 1,000,000,000 tons of animal manures generated in the United States each year. The manures are dumped into ponds where they stimulate the rapid growth of the plant life on which some fish feed. The fish can then be harvested for human consumption. Also, an aquatic plant species, Ipomoca repens, which is a suitable pig feed, can grow rapidly in the manure-fertilized ponds. A pig farm in Malaya flushes the manure from 700 pigs into eight fish ponds, covering 2 1/4 acres, stocked with Siberian white Amur and Tilapia mossambica. About 9,000 lb of fish were produced in the first year, and up to 1,250 lb of Ipomoca repens can be harvested daily in peak seasons. The white Amur, buffalo fishes, and Tilapia have all been successfully farmed using this system, and all are considered highly desirable foods for humans. Several species of shellfish, large fresh-water shrimp, and silver and spotted Amur are also being considered as potentially adaptable to the system. Fish farming gives high investment returns, so that, with this system, both animal waste and idle-land problems can be economically solved. (East Central State College)
W75-04555

RECYCLE ORGANIC WASTES AS FEED FOR MEAT ANIMALS.
Compost Science, Vol 12, No 6, p 19, November-December 1971.

Descriptors: *Waste disposal, *Recycling, *Farm wastes, *Organic wastes, Feeds, Livestock, Nutrients, Sawdust, Fertilizers, *Pennsylvania, Waste treatment.
Identifiers: Meat.

Zoologists at Penn State University have been experimenting with feeding farm animals several forms of organic wastes, most of which are of nutritional value. When adequately supplemented with protein, vitamins and minerals, wastes can serve as excellent animal feeds; in addition disposal problems are reduced in a manner which is more economically feasible than is spreading on fields as a fertilizer. Now that DDT is no longer used on orchard trees, apple pomace should be fed to ruminants, for whom it is a satisfactory energy source. Ground waste paper soaked in blackstrap molasses was readily eaten by ruminants, as was sawdust, a roughage substitute which seems to contribute to lower rates of liver abscesses. Finishing rations containing sterilized poultry wastes had not effect on weight gain, meat, carcass quality, or any other factors under study. None of these feeds produced unacceptable levels of arsenic, chlorinated hydrocarbons, or pesticides in meat, fat, or liver tissue. Although consumer acceptance is one stumbling block to such a feed program the technology for this form of waste utilization is already available. (East Central State College)

MICROBIOLOGICAL PRODUCTION OF GEOSMIN,
Rutgers - The State Univ., New Brunswick, N.J. Inst. of Microbiology.
N. N. Gerber.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Cincinnati, Ohio, Report EPA-670/2-74-094, p 8, November 1974. 1 fig, 3 tab, 12 ref. 1CB047; ROAP 21AQB; Task 9, R-801630.

Descriptors: *Odors, Odor control, Microorganisms, Fermentation, Chromatograpy, *Actinomyces, *Waste water treatment, Sampling, Water quality standards.
Identifiers: Methylisoborneol, *Standard samples, *Geosmin production, *Streptomyces.

Geosmin, trans-1, 10-dimethyl-trans-9-decalol, is produced by numerous actinomycetes and some blue-green algae. It has been shown to be responsible for earthy/musty odors in public water supplies. Samples of purified geosmin were needed for use as odor standards and for use in water treatment unit process development studies. This work was carried out to fulfill this need. The microorganism, Streptomyces sp. CWW3, was grown for 5 days at 28 deg with shaking in a broth medium. The mixture was steam distilled and the clear distillate extracted with methylene chloride. The geosmin containing methylene chloride extract was separated and the geosmin purified by column and gas chromatography. Seven hundred nine milligrams of geosmin was prepared. (EPA)

SURGE FACILITY FOR WET AND DRY WEATHER FLOW CONTROL,
Y-T-O and Associates, Walnut Creek, Calif.
H. L. Welborn.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Cincinnati, Ohio, Report EPA-670/2-74-075, p 86, November 1974. 25 fig, 24 tab. 1BB034; ROAP 21-ASY; Task 140, EPA Demonstration Project S800769.

Descriptors: *Surge tanks, *Storm surges, Flood control, *Flow control, Sewage, Sewage disposal, Flow measurement, Flow distribution, Sewage treatment , *Settling basins, *Storage tanks, Underflow, Sedimentation tanks, Water influx, *Infiltration, Wastewater treatment.
Identifiers: Surge basins. Flow equalization, Sludge removal, Pool sweep, Sedimentation-equalization, Peak storm flow.

A surge facility was tested which provided peak flow equalization and some degree of treatment to all storm flows and rate control of all wet and dry weather wastewater flows. The facility was designed to test a method whereby solids could be prevented from accumulating on the bottom of an inexpensive earthen, lined basin without the use of conventional mechanical sludge collection equipment. The principal features of the surge facility were a 2,841 cubic meter (0.75 million gallon) Sedimentation-Equalization Basin, variable underflow pumps, a surface aerator and Pool Sweeps. The Pool Sweeps were used to continuously 'sweep' the bottom and sides of the earthen, lined basin to move and temporarily resuspend the settled sewage solids and, thereby, maintain the flow of solids in the absence of mechanical collection mechanism, steep bottom slopes, or a completely mixed basin. Under the storm flow conditions, the surge facility removed approximately 45 percent of the influent Suspended Solids and 90 percent of influent Settleable Solids prior to overflow to a storage pond. Although a significant portion of the solids flow through the surge basin could be attributed to the operation of the Pool Sweeps, their overall performance could not justify their use in other similar facilities. DRY CAUSTIC PEELING OF CLINGSTONE PEACHES ON A COMMERCIAL SCALE,
Del Monte Corp., San Francisco, Calif.
H. E. Stone.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Corvallis, Oregon, Report EPA-660/2-74-092, December 1974. 61 p, 5 fig, 11 tab, 5 ref, append. 1BB037, EPA Grant. No 12060 HFY.

Descriptors: *Canneries, *Water pollution sources, Peaches, Costs, Liquid wastes, *Waste water treatment, Industrial wastes.
Identifiers: Food processing, Canning, Liquid waste reduction, *Fruit peel removal.

This study evaluates the peel removal ability and rinse water characteristics for the first commercially sized equipment using the principle of rapidly rotating rubber discs to gently wipe softened peel off Clingstone peaches. The conventional process utilizes large volumes of fresh water to remove the softened peel and flush it into the liquid effluent from the plant from where it cannot be easily separated. The dry caustic unit demonstrates that gentle abrasion can remove the softened peel, yield a peach suitable for commercial canning and allow for separation and collection of a major portion of this solid residue; thereby preventing its entry into the liquid waste stream. In addition to an approximately 60% reduction in the BOD loading in the liquid waste stream, an approximately 90% reduction in the fresh water requirement for this phase of the preparation of Cling peaches is demonstrated. These reductions in volume of liquid effluent and in the total pounds of organic matter which must be treated are beneficial to both private and public wastewater treatment facilities. A potential increased operating cost to the canner is indicated to be attributable to slightly increased peel loss and to costs associated with the handling of solid residues separated and collected from the dry caustic peeler. W75-04564

SEPARATION, DEWATERING AND DISPOSAL OF SUGARBEET TRANSPORT WATER SOLIDS, (PHASE I),
American Crystal Sugar Co., Denver, Colo.
I. V. Fordyce, and A. M. Cooley.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Corvallis, Oregon, Report EPA-660/2-74-093, p 66, December 1974. 7 fig, 13 tab, 7 ref, 3 append. 1BB037; Task 21 BAB/083, EPA Grant No 12060 ESC.

Descriptors: Separation techniques, *Waste water treatment, Water quality control, Water reuse, Waste treatment, Treatment facilities, Pollution abatement, Industrial wastes, *Sugarbeets, Coagulation, Sludge disposal, Filtration, Dewatering.
Identifiers: pH control.

The objectives were to determine the settling characteristics of solids from sugar beet washing and fluming operations in a clarifier, the filtering characteristics of the underflow slurry from a clarifier and the disposal of the filter cake without subsequent development of objectionable odors. The results were to be used to determine the feasibility of installing full scale filters for filtration of and removal of the suspended solids from the transport water and complete recycling of water.

Buildup of organic matter in the water and consequent bacterial growth necessitated the maintenance of high pH by addition of slacked lime. It was necessary also at intervals to add paraformaldehyde to control bacterial growth. Dosages are given. Best conditions for filtration were obtained when the underflow from the clarifier was heated, the pH was maintained over 10.5 and when the waste lime cake from beet juice purification was added to the feed to the clarifier. The filter cake which was accumulated was disposed of on farm and by three different methods and did not develop objectionable odors in any of the methods used. (EPA)
W75-04565

WATER RECYCLE/REUSE POSSIBILITIES: POWER PLANT BOILER AND COOLING SYSTEMS,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, price $1.15. Environmental Protection Agency, Corvallis, Oregon, Report EPA-660/2-74-039, p 51, December 1974. 13 fig, 7 tab, 15 ref, 2 append.

Descriptors: Water types, Industrial water, Water costs, *Water demand, *Water reuse, Cooling water, Waste water treatment, Recycling, Boiler feed water.

The methodology to evaluate, in economic terms, potential power plant boiler and cooling system water recycle/reuse programs is presented. Drum type boiler systems and closed cycle cooling systems are used as the basis for the programs' water requirements. The evaluations take into account the variable plant characteristics such as makeup water quality, fuel type, thermal efficiency, capacity factor and fixed charge rate. The evaluation methodology is applicable to existing and proposed power plants, on an individual plant basis—and can be used to determine the over-all economics of potential recycle/reuse programs. BACTERIAL ZOOGLOEA FORMATION,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
J. F. Unz, and S. R. Farrah.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 235 [illegible] $4.75 paper copy, $2.25 microfiche. Environmental Protection Agency, Cincinnati, Ohio, Report EPA-670/2-74-018, April 1974. 86 p, 35 fig, 18 tab, 71 ref. 1BB043/21ASR/003.

Descriptors: *Activated sludge, *Bacteria, Flocculation, Polymers, Scum.
Identifiers: *Zoogloea sp., Zoogloea ramigera, Zoogloeal bacteria, Flourescent antibody.

Activated sludge flocs suspended in wet mounts on microscope slides were observed to sprout, finger-like, bacterial zoogloeae as a consequence of the outgrowth of bacteria from flocs. The rate of extension of finger-like zoogloeae was typically [illegible] to 15.0 micro per hr and mean cell doubling time was estimated to be approximately 2 hrs. Epifluorescent and fluorescent antibody studies revealed that the bacterial zoogloeae consisted of the progeny of specific zoogloea-forming bacteria. Purified exopolymers of Zoogloea strains and domestic activated sludge contained two neutral sugars, one of which was identified as glucosamine. Zoogloea exopolymer was not fibrilar or cellulosic and contained approximately 17 to 19 per cent amino sugar and about one per cent hexoses, uronic acids and ether soluble substances on a dry weight of polymer basis. Amino sugar production was found to parallel zoogloea formation by Zoogloea sp. Calcium ion appeared to augment flocculation of bacterial cells capable of undergoing natural coalescence. Two cell types, described as rough and smooth colony-forming, were found in some strains of Zoogloea. Rough cells readily flocculated in agitated cultures whereas smooth cells produced relatively turbid cultures under similar growth conditions. A predominance of one of the two types could influence the degree of flocculation by Zoogloea cultures. (EPA)

AN ASSESSMENT OF WET SYSTEMS FOR RESIDENTIAL REFUSE COLLECTION: SUMMARY REPORT,
Curran Associates, Inc., Northampton, Mass.
P. M. Meier, J. Kuhner, and R. E. Bolton.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 236 085, $5.25 paper copy, $2.25 microfiche. Environmental Protection Agency, Report EPA-670/2-74-068, August 1974. 92 p, 14 fig, 11 tab, 9 ref. 1DB064/ROAP-09ADA/Task 04 EPA Contract 68-03-0183.

Descriptors: *Wastes, Sewers, Waste disposal, Economics, *Pipelines, Transportation, Mathematical models, Sewage treatment, *Waste water treatment, *Domestic wastes.
Identifiers: *Solid waste collection, Ground refuse transport, Economic feasibility study, *Hydraulic transport, *Combined refuse/sewage treatment, *Grinders(Refuse).

The most promising wet system alternative is identified as a system using individual household grinders in low density areas, vacuum collection and neighborhood grinders in high density areas, dilute slurry transport of ground refuse in the existing sanitary sewer system, and joint treatment of refuse and sewage at an expanded treatment facility that includes anaerobic digestion for methane generation. However, the economic feasibility of even the most promising alternative is doubtful because of the high cost of grinding, and hydraulic transport of ground refuse in existing sewer systems may be feasible only if both metals and glass are excluded. A conventional collection of the nongrindable and bulky constituents of residential refuse will still be needed, albeit of a diminished frequency. The total 1973 cost of such a wet system is estimated at $113-196 per household per year, of which $80-$105 is for grinding. This compares to a total cost for refuse and sewage collection and disposal under existing concepts of up to $115 per household per year. Projections for 1988 indicate that the wet system cost might rise to $130-$228, against a range of $61-$143 under conventional concepts. However, if the cost of the grinder is excluded (on the basis that individuals would purchase grinders for their convenience benefits), the 1973 wet system costs (to the public sector) would be only $33-$91, thus possibly less than existing public sector costs of about $43-$115 per household per year. CONTROL OF POLLUTION FROM ANIMAL FEEDLOTS AND REUSE OF ANIMAL WASTES,
Committee on Government Operations (U.S. House).
93rd Congress, 2nd Session, House Report No 93-1012, 1974, 68 p. 1 fig.

Descriptors: *Water pollution, Control, *Feed lots, *Farm wastes, *Livestock, Legal aspects, Permits, Regulation, Fertilizers, Fuels, *Recycling, *Waste treatment, Waste disposal, Cattle.

The Federal Government's efforts to control pollution from animal feedlots by more efficient management of wastes and by encouragement of their reuse as fertilizer and fuel are reviewed. The nature of feedlot pollution from feedlots, and the current EPA policies for control are discussed. Also discussed is the pollution problem versus the administrative problem. Permit requirements for point source pollutors, are described. Appendices the types of animal feedlots, and the EPA's authority to exclude point sources from the permit program. Supplemental views of Hon. John C. Culver and dissenting views of HON. Charles Thone are included. (Russell-East Central)

DEVELOPMENT OF AN ORGANIC WASTE SLURRY INJECTOR,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
R. C. Gold, and J. L. Smith.
Paper No 73-4529, presented at 1973 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-14, 1973, 12 p. 6 fig, 15 ref.

Descriptors: *Farm wastes, Organic wastes, *Waste disposal, *Slurries, *Injection, Irrigation, Odor, Aesthetics, Economics, Ground water, Runoff, Soil analysis, Insects, *Waste water treatment, *Water reuse.
Identifiers: *Land spreading, Deep plowing.

Organic waste disposal methods have changed little over the last several decades. However, these usually create aesthetic and pollution problems which have resulted in an attempt to find new and better ways to dispose of organic wastes. The presence of organic matter and some plant nutrients makes the idea of recycling organic wastes to the soil very desirable. The four usual methods for returning materials to the soil are irrigation, surface spreading, deep plowing or burial, and shallow plowing or injection. Since surface application creates problems, experiments were conducted using a slurry injection system. This type of system offers these advantages: (1) it is inexpensive; (2) it is capable of handling large volumes of wastes; (3) it eliminates odors, visibility, and aesthetic pollution problems; (4) it can be used in any part of the country with sufficient storage capacity for cold weather; (5) it can be operated by one person; and (6) the wastes are recycled and their benefits are not lost. (Russell-East Central)

TAILOR MADE CONFINEMENT BARN,
B. Fleming.
Beef, Vol 10, No 7, p 8-9, March, 1974. 4 fig.

Descriptors: *Farm wastes, *Confinement pens, *Management, Fertilizers, Design, Oxidation lagoons, Lagoons, Costs, Ventilation, Insulation, Waste disposal, Waste storage, Odor, *Iowa.
Identifiers: Barns, Land spreading, Slats.

A confinement barn operation should fit a feeder's personal needs. Lee and Roy Stoll had that in mind when they designed their own confinement barn. The barn was 256 ft. long. The south side of the barn was always open. The cattle were fed by a 250 ft. belt feeder which ran down the middle of the building. The manure handling system consisted of an eight ft. deep pit system. The manure was reclaimed as fertilizer at an estimated savings of about $23 per acre. Other unique arrangements in the barn were varied pen size and slats for the background lot. Drafts were eliminated by using wall-like dividers and insulation. The manure pit

was eight ft. deep, but only about two feet of that was below grade. The rest was built above ground and fill dirt was added. The stall operation is a carefully matched setup, and is tailored for their specific operation. (Russell-East Central)
W75-04617

SEWAGE-GROWN ALGAE AS A FEEDSTUFF FOR CHICKS,
Dept. of Poultry Husbandry. California Univ., Davis.
C. R. Grau, and N. W. Klein.
Poultry Science, Vol 36, p 1046-1051, 1957. 6 tab, 8 ref.

Descriptors: *Algae, *Feeds, *Poultry, *Proteins, *Aluminum, Flocculation, Centrifugation, Neutralization, Sewage.
Identifiers: Chicks, Acid extraction, Tolerance.

Sewage-grown algae meals, which contain about 40% crude protein, have been studied as sources of protein and other nutrients for young chicks. All feeding trials were performed with White Leghorn chicks which were fed a stock diet for ten days after hatching, and then were fed the experimental diets for the next eight days. Both alum-flocculated and centrifugated samples were fed. The chicks tolerated diets containing up to 20% aluminum-free algae meal. The presence of significant amounts of aluminum in the meal depressed chick growth. Neutralization and acid extraction have been unsuccessful in removing the harmful effects of the aluminum. The presence of dark, watery droppings was the only observed adverse effect of feeding the algae meals. This condition was found with alum-flocculated and aluminum-free meals. (Cameron-East Central)

NEW AEROBIC PROCESS TURNS WASTE TO NUTRIENTS,
AgChem and Commercial Fertilizer, Vol 27-28, No 12-1, p 24-27, December 1972-January, 1973. 7 fig.

Descriptors: *Farm wastes, *Nutrients, *Fertilizers, Feed lots, Cattle, Feeds, Urine, Aerobic conditions, *Ohio, *Aerobic treatment, *Waste treatment.
Identifiers: *Digestors.

The first animal-waste, large scale sterilized organic fertilizer capability is being developed by the operator's of Ohio Feed Lot-the world's largest pollution-free enclosed cattle feedlot. Cattle manure is collected by front-loading tractors, dumped into large fan ventilated vats and fed to an aerating digestor. Once the manure is sterilized it is bagged and packaged in 5, 10, 25, and 50 pound bags for use as organic fertilizer and sold. Great pains have been taken to make this feedlot operation as self sufficient and environmentally ameliorating as possible. Techniques include utilization of natural air flow (aided by fans), the creation of an impermeable feedlot surface, and the development of a guarded cattle diet using the feedlot's own corn-based feed. (Drewry-East Central)

NUTRIENT RECOVERY: NEW CONCEPT IN WASTE HANDLING,
P. D. Andre.
Beef, Vol 10, No 7, p 74-76. March, 1974, 6 fig, 1 tab.

Descriptors: *Nutrient removal, *Farm wastes, *Waste water treatment, *Recycling, Water purification, *Confinement pens, Model studies, Bacteria, Separation techniques, Irrigation, Fertilization.
Identifiers: *Waste handling, Refeeding.

In the near future, cattle feeders may begin to use a nutrient recovery system as an integral part of a confinement feeding building. Such a system has been developed and is currently undergoing experimentation. This system starts with raw manure and through a series of three stages removes the organic and inorganic nutrients for animals and field crops, ending with clear water. In the first stage, 30% of the total available dry solids can be removed. The second stage, which can involve up to five steps, removes most of the remaining nutrients. The third stage is a water purification stage. The cost of such a system is very high, but experiments indicate that returns from the system can be considerably higher than the cost. The nutrient value of the extracted wastes appears to be very high, and a well balanced high protein feed is the result of the process. Although there are minor problems to overcome, the Corral Nutrient Recovery System's designers are confident that it will offer substantial gains for confinement feeding. (Russell-East Central)

SLATS IN THE SOUTHWEST,
P. D. Andre.
Beef, Vol 10, No 1, p 62, 70, 71, September, 1973. 3 fig.

Descriptors: *Confinement pens, *Performance, Cattle, Costs, Lagoons, Sprinkling, Waste disposal, Southwest U.S., Waste Treatment, *Arizona.
Identifiers: *Slats, Open feed lot.

Operational facilities are described for a confinement facility with a capacity for 10,000 head of cattle. The advantages of the confinement pen versus the open pens are given in detail. Only seven acres are needed for the confinement pen versus 30 for the open pens. Confinement, it is estimated, should save hiring two men, as compared to open lots. Since the feed truck only has to travel over seven acres rather than 30, another savings of $1,800 is listed. Other advantages are: more pleasant working conditions for employees, ease of handling animals, possible improvement in conversion rates and death loss, odor and fly control, pollution prevention, easier management and supervision, more consistent quality of beef, faster turnover of cattle at lighter weights, and longer total life of the facility. Severe performance slumps due to weather can also be avoided; consequently, management can project business more accurately. There is an estimated $100,000 yearly advantage for this Arizona feedlot in choosing confinement rather than open lot. (Cartmell-East Central)

FAST FLUCH SYSTEM,
R. H. Brown.
Feedlot Management, Vol 15, No 11, p 10-12, November, 1973. 4 fig.

Descriptors: *Farm wastes, *Cattle, *Waste water treatment, *Waste disposal, *Feed lots, *Irrigation, Slopes, *South Carolina.
Identifiers: Forage yields.

A southeastern U.S. cattle farm uses fast flushing to remove wastes from concrete floors. Walworth Farms, feeding up to 5,000 head of cattle, flushes the 21/2% sloping floor with up to 9,000 gallons of water. Runoff flows into a catch ditch to an underground pumping station which further liquifies it and then it flows into portable irrigation pipes. The runoff irrigates up to 1,600 acres of grassland and cropland. The farm also has two lagoons to handle excess water when there are heavy rains. (Frantz-East Central)

CHARACTERISTICS AND SOIL TREATMENT OF BIOLOGICALLY TREATED SWINE WASTES, VOL. I, CH.1 THRU 3,
Kansas Water Resources Research Inst., Manhattan.
C. E. Burkhead, and M. Trnovsky.
Available from the National Technical Information Service, Springfield, Va., 22161 as PB-239 521 $5.75 in paper copy, $2.25 microfiche. WKRRI Contribution No 132, February 1974. 118 p, 6 fig, 23 tab. OWRT A-042-KAN(1), 14-31-001-3516.

Descriptors: *Soil treatment, *Oxidation lagoons, Hydraulic conductivity, *Biological treatment, *Farm wastes, *Waste water treatment, Feasibility studies, Waste identification, Waste disposal, Water reuse, Soil types, *Kansas, Infiltration, Path of pollutants.
Identifiers: *Swine wastewater, *Land disposal, *Waste characterization, *Holding ponds, *Percolate characteristics, Soil columns, Loading and resting cycles.

Feasibility of treatment and disposal by land application of a holding pond supernatant receiving effluents from oxidation ditches treating swine waste generated in a confined hog growing operation was investigated. The performance of the three oxidation ditches and the holding pond was evaluated. The evaluation was based on statistical analyses of physical and chemical characteristics of the oxidation ditch effluents and the holding pond supernatant. The wastewater was analyzed from data collected from ten random samples for each of the following sampling locations: effluents from the oxidation ditches, the holding pond supernatant, and well water. In addition, data on water consumption, number of hogs in the buildings, and rainfall data were collected. Suitability of five typical Kansas soils for treatment and disposal of the holding pond supernatant was investigated in fifteen indoor soil columns. The columns contained disturbed soil samples representing the following textural classes: sand, sandy loam, silt loam and clay. The wastewater was applied to the column in alternate loading-resting cycles. Infiltration rates and quality changes of the percolate were monitored. Changes in the soil's chemical characteristics as brought about by the application of the supernatant were determined on ten soil columns' increments upon termination of testing. (See also W75-04624)

CHARACTERISTICS AND SOIL TREATMENT OF BIOLOGICALLY TREATED SWINE WASTE, VOL II, CH. 4, THRU 7,
Kansas Water Resources Research Inst., Manhattan.
C. E. Burkhead, and M. Trnovsky.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-239 522 $7.25 in paper copy, $2.25 microfiche. KWRRI Contribution No 132, February 1974. 202 p, 76 fig, 23 tab, 183 ref. OWRT A-042-KAN(1) 14-31-0001-3516.

Descriptors: *Soil treatment, *Oxidation lagoons, Hydraulic conductivity, *Biological treatment, *Farm wastes, *Waste water treatment, Feasibility studies, Waste identification, Waste disposal, Water reuse, Soil types, *Kansas, Infiltration, Path of pollutants.
Identifiers: *Swine wastewater, *Land disposal, *Waste characterization, *Holding ponds, *Percolate characteristics, Soil columns, Loading and resting cycles.

Variation among the physical and chemical characteristics of the oxidation ditch effluents and the holding pond supernatant provided evidence of unsatisfactory in-building management, causing overloading of the oxidation ditches and accumulation of biodegradable pollutants in the oxidation ditch mixed liquor as well as in the holding pond supernatant. Application of the supernatant to the selected soils demonstrated that the soil's reten-

on capacity for the supernatant constituents is efinitely limited. The soil's retention capacity increased with the clay content of the soil and ecreased with the wastewater volume applied. In e course of testing, the quantity of the supernant soluble organics, salts, alkalinity, and cations the column's effluents increased appreciably ith an increase in quantity applied. Basic relaonships controlling the transformation of the ajor wastewater constitutents are described. ee also W75-04623)

SWINE WASTE MANAGEMENT SYSTEMS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
B. Horsfield, J. Gottbrath, and J. Kadlec.
Paper No 73-4517 presented at the 1973 Winter Meeting of the American Society of Agricultural Engineers, Chicago, Illinois, December 11-14, 1973, 33 p. 9 fig, 10 tab, 15 ref.

Descriptors: *Hogs, *Farm wastes, *Waste treatment, *Management, *Evaluation, Costs, Lagoons, Confinement pens, Economics, Waste storage, Separation techniques, Transfer, Transportation, Waste disposal, Odor, Water pollution, Irrigation, Performance.
Identifiers: Oxidation ditch, Slatted floors, Land disposal.

Five unique waste handling systems for confinement finishing hogs were studied and were compared with two common systems. The five systems were: (1) a deep pit with wood slats and earth bottom; (2) partial wood slats, a shallow pit and a two-stage lagoon; (3) full wood slats with a shallow pit and lagoon; (4) a solid concrete floor with flushing and a two-stage lagoons; and (5) partial slats and air diffusion oxidation. The two common systems were; (A) concrete slats and concrete pit; and (B) concrete slats and pit with oxidation ditch and outside storage. Both cost and noncost factors were taken into consideration. The costs ranged from $.75 to $3.89 per head produced if the nutrient value of the wastes were ignored. (Russel-East Central)

EFFECT OF FEEDLOT LAWS AND CLIMATE ON OPEN FEEDLOT WASTE MANAGEMENT,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
A. F. Butchbaker, J. E. Garton, G. W. A. Mahoney, and M. Paine.
Paper No 72-438, presented at 65th Annual Meeting, American Society of Agricultural Engineers, June 27-30, 1972, Hot Springs, Arkansas, 38 p. 12 fig, 6 tab, 16 ref.

Descriptors: *Feedlots, *Regulation, *Legal aspects, *Climates, *Farm wastes, Management, Design, Costs, Precipitation(Atmospheric), Storms, Evaporation, Water pollution, Irrigation, Solid wastes, *Waste treatment.
Identifiers: Storm rainfall, Opean feed lots, Holding ponds.

The effects of climate and the impact of feedlot laws on waste management systems were examined. Analysis of the engineering design requirements for feedlots was made by searching the literature, observing feedlot operations, performing operational analysis of waste handling systems, and from personal conversations. Feedlot laws for regulation runoff control are aimed at reducing the water pollution potential by means of holding ponds. For the waste management systems, the major climatic factors are: annual precipitation, storm rainfall, annual evaporation, and temperature. Analysis of the various alternatives for handling the feedlot waste was done by analyzing the field observations and utilizing the computer to generate design information to perform calculations for comparing the cost of various systems. For a 20,000 head open feedlot with pollution control, the total system costs (Feedlot construction plus waste management systems) are approximately 0.01319 dollars per animal day with an investment cost of approximately $416,000. (Cartmell-East Central)

MANAGEMENT OF SWINE WASTE BY A LAGOON SYSTEM,
Washington State Univ., Pullman. Dept. of Agricultural Engineering.
R. E. Hermanson, and J. L. Koon.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1172-1174, 1178, 1973. 4 fig, 1 tab, 9 ref.

Descriptors: *Management, *Farm wastes, *Hogs, Lagoons, *Waste treatment, Water pollution, Aerobic treatment, Anaerobic conditions, Odor, Effluent, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Phosphorus, Bacteria, Sampling.
Identifiers: *Swine, Land disposal.

A two-stage anaerobic-aerobic lagoon system can provide a significant reduction in pollutional characteristics of swine waste. The addition of an aerated second stage to an anaerobic lagoon resulted in effluent with mean DOD and COD reductions in the aerated lagoon of 72 and 45%, respectively. A detention time of 2 weeks in the aerated lagoon resulted in average BOD and COD reductions almost equal to those obtained in a 4 or 5 week detention time for the anaerobic lagoon. Total nitrogen was reduced an average of 18% for the 2 week detention in the aerated lagoon and 53% for the 9 week detention. Although significant reductions in effluent concentrations were achieved, the end product was still quite polluted. The levels of BOD, COD, N2, and P along with solids and color, in most states, limited the discharge of wastes from this two-stage system into receiving streams. Disposal on land was the only feasible alternative. The primary effect of the aerated lagoon was the reduction of odor and the amount of pollutants that the land was forced to handle. (Russell-East Central)

HE SOLVED HIS MANURE HANDLING PROBLEM,
Wisconsin Univ., Madison.
T. J. Brevik.
Hoard's Dairyman, p 357, March 10, 1973. 1 fig.

Descriptors: *Farm wastes, *Dairy industry, *Waste treatment, *Waste storage, *Feed lots, *Runoff, Water pollution, Design, *Wisconsin.

A Wisconsin farmer developed a waste handling system that prevented barnyard runoff from running down a slope into a nearby stream. The plan included a 50x50x11 ft. concrete storage pit and curbs which diverted runoff from its natural course. A manure thrower was positioned at the end of the barn to sling wastes into the pit. A 40x60x7 ft. detention pond was recently added. (Frantz-East Central)

Identifiers: Composting.

Most current research efforts are attempting to incorporate the use of manure as an asset instead of a liability. The future promises that manure disposal will be designed to make it pay for itself and, in some cases, provide a profit. Methods for manure disposal, are outlined. They are: (1) Composting manure and selling it; (2) Recycling the liquids and treating manure; (3) Using treatment tanks to decompose manure; (4) Using a hog manure supplement; (5) Piping manure underground to a storage tank; (6) Screening out the

solids; (7) Using an oxidation ditch; (8) Storing manure above ground; and (9) Growing fish in manure lagoons. Some of these nine methods of manure handling are now being used, while others are futuristic. Some will be useful and economical, and some will be impractical. (Russell-East Central)

TENTATIVE CRITERIA FOR DESIGN, CONSTRUCTION AND OPERATION OF THE BATCH TYPE PASVEER OXIDATION DITCH SYSTEM FOR THE TREATMENT OF ANIMAL WASTES,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
A. C. Dale.
February 15, 1968, 20 p. 30 fig, 2 tab, 20 ref.

Descriptors: *Design, Construction, *Operations, *Oxidation lagoons, *Farm wastes, *Waste treatment, Aeration, Digestion, Aerobic bacteria, Anaerobic bacteria, Oxygen, Odor, Volatility, Biochemical oxygen demand, Nitrates, Nitrites, Temperature, Water pollution.
Identifiers: Batch-type oxidation ditch, Facultative bacteria, Continuous treatment system.

A continuous oxidation ditch was developed by the Research Institute for Public Health Engineering, The Netherlands, as a low-cost method for purifying sewage emanating from small communities. The system is a modified form of activated sludge process and may be classified in the extended aeration group of odorless aerobic treatments. For either batch or continuous oxidation ditches to work satisfactorily, an aerator is used to 'beat' oxygen into the waste to support the growth of bacteria and to hold the solids in suspension. Unlike the continuous system, wastes are dumped into the batch oxidation ditch periodically and the aerator is not run continuously. The batch-type ditches reduce dry matter by about 40 to 50% by converting organic matter into carbon dioxide and water. The ditch releases some nitrogen but converts most of it into nitrites and nitrates. The pit (ditch) storage time may be increased by 80 to 90% provided effluent level can be controlled and oxygen transfer is possible at the greater suspended solids content. The oxidation ditch also concentrates the minerals and salt, by about 70 to 90% in the batch process. The design and operation of the oxidation ditch system are discussed. (Cameron-East Central)

TEST SWINE WASTE DISPOSAL SYSTEMS,
Iowa State Univ., Ames.
T. Hargrove.
Wallace's Farmer, Vol 96, p 30, July 24, 1971. 3 fig.

Descriptors: *Hogs, *Waste disposal, *Farm wastes, Testing, Water pollution, Air pollution, Lagoons, Sprinkler irrigation, Water hyacinth, Nutrients, Effluent, *Iowa.
Identifiers: *Swine, Gutters, Flushing.

Iowa State has installed a gutter system in a hog house with a 100-gallon flush lasting 20 seconds once an hour. The swine cooperate. Flushings may be routed to an anaerobic lagoon, an oxidation ditch, or the lagoon and ditch in turn. The excess is spread on corn and/or grassland. Flushing water is recirculated. Water hyacinths are being tested for removal of nutrients from effluents followed by use as cattle roughage. Iowa winters will keep them from becoming a nuisance. (East Central State College)

IRRIGATION FOR LAND APPLICATION OF ANIMAL WASTE,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
B. C. Horsfield, R. Z. Wheaton, J. C. Nye, and J. V. Mannering.
(1973). 20 p. 7 fig, 7 tab.

Descriptors: *Farm wastes, *Irrigation, *Waste disposal, Livestock, Crops, Soils, Runoff, Costs, Equipment, *Indiana, *Water reuse, Water treatment.
Identifiers: *Land application.

Irrigation may be the best means of putting farm wastes back onto the land. Runoff detention, combination manure-and-runoff, and covered manure facilities are described. Major soil and cropping factors affecting irrigation rate are evaluated. Irrigation equipment and systems' costs are described. Tips are given on waste storage management, irrigation equipment use, soil conditions, and crop utilization practices. Only with proper management can the farmer attain the desired results of irrigation. (Frantz-East Central)

SUBFLOOR MONITORING OF SHADY GROVE DAIRY LIQUID MANURE HOLDING POND,
San Bernadino County Agricultural Extension Service, Calif.
J. C. Oliver, W. C. Fairbank, J. L. Meyer, and J. M. Rible.
California Agriculture, Vol 28, No 4, p 6-7, April, 1974. 1 fig, 6 tab.

Descriptors: *Monitoring, *California, *Dairy industry, *Liquid wastes, *Sealants, *Seepage control, Chemical properties, Farm wastes, Waste treatment, Pollutant identification.
Identifiers: *Subfloor, *Holding ponds.

Subfloor monitoring of the Shady Grove Dairy liquid manure holding pond was begun in June, 1972, with the installation of duplicate tensiometer cups at 2,4,6,8, and 9 ft. below the pond floor. Extracts for analysis were collected weekly from ceramic cups for the first six weeks after the pond was filled with manure water. Results of chemical analyses of soil solution extracts from beneath the pond were given. This subfloor monitoring technique established that the dairy waste pond had become effectively sealed. The soil solution analysis as compared with original soil analysis data, leads to the conclusion that sealing of ponds takes place essentially in the upper 6 ft. of soil in a pond bottom. PNEUMATIC TRANSPORTATION OF MANURE,
All-Union Research Inst. of Cattle-breeding, Podolsk (USSR).
A. N. Shimko.
Transactions of the ASAE (American Society of Agricultural Engineers), Vol 16, No 6, p 1170-1171, Nov-Dec, 1973. 1 fig, 3 ref.

Descriptors: *Waste treatment, *Waste storage, Fertilizers, Nutrients, Economics, Organic wastes.
Identifiers: *Pneumatic transportation, Holding tanks, Manure pits, Land spreading.

In Russia, the work involved in loading, unloading, and transporting manure accounts for approximately 40% of all the labor expended on farms. About one-half of this amount is required for handling manure. A pneumatic system was designed to transport and load manure into storage structures on livestock farms of 100 to 2,000 head of cattle. This system eliminated tractors, transport units, and traffic in moving manure from barns to pits. It also provided the means to convey, receive, and store for long periods high quality organic fertilizer without the loss of nutrients. The system involves transportation of manure from barns to the manure tank. When the tank is full, it becomes pressurized to about 6 atmospheres. The manure is then sent through a pipeline and stored at the bottom of a pit. The upper layers of the pi dry and reduce odors. When needed, the top layer are removed and used for fertilizer. (Russell-Eas Central)

CHANGING FROM DUMPING TO RECYCLING. PART 2. ORGANIC WASTES,
California Univ., Berkeley. Sanitary Engineerin Research Lab.
C. G. Golueke.
Compost Science, Vol 13, No 2, p 20-23, March April 1972.

Descriptors: *Recycling, *Organic wastes *Wast treatment, Feeds, Chemicals, Ponding, Anaerobi digestion, Activated sludge, Trickling filters, Sta bilization, Oxidation lagoons, Fermentation.
Identifiers: Pyrolysis.

Methods of recycling the major groups of organi wastes (such as food processing wastes, manure and wood wastes) are discussed. Their recyclin creates three major products: soil, foodstuffs, an useful chemicals. The present treatment method concentrating on elimination of wastes rather tha reclamation, are reviewed. Ponding is accon plished using anaerobic ponds, facultative pond oxidation ditches, and high-rate ponds. The trea ment mechanism in the trickling filter is aerobi biological stabilization of organic waste suspended or dissolved in water. The activate sludge works on the same principle; it differs fro the trickling filter process because no surfaces a provided for the attachment of a microbial layer; is a compact process, subject to fairly close co trol. In the anaerobic digestion process, biologic decomposition takes place in the absence of o ygen. (East Central State College)

IN-THE-BUILDING OXIDATION DITCHES FO LIVESTOCK WASTES,
Illinois Univ., Urbana. Dept. of Agricultural E gineering.
D. L. Day.
Water and Wastes Engineering, Vol 7, No 9, p 23-E-24, September 1970.

Descriptors: *Oxidation lagoons, *Farm waste *Livestock, *Waste treatment, *Aerobic trea ment, Effluents, Nitrates, Biochemical oxygen d mand, Odor, Phosphates, Lagoons, Was storage, Waste disposal.
Identifiers: In-the-building oxidation ditche Biological oxidation, Land disposal.

Aerobic treatment for the removal of biodegrad ble organic matter from liquid wastes is an odo less process consisting of two phases operati simultaneously. One phase is biological oxidati that gives by-products such as carbon dioxide a water, and yields energy. The second phase u izes the energy from the oxidation for synthesis new cells. The in-the-building ditch for livesto wastes is a completely mixed aerobic system ha ing a long detention time. The ditch is locat beneath the self-cleaning slotted floors in a co finement building. The liquid volume is about cu ft/pound of daily BOD5. The liquid depth shallow to keep the solids suspended. The depth kept constant by using an overflow for the mix liquor. After the bioxidation system comes equilibrium, the mixed liquor BOD5 will typica be 3,000 to 5,000 mg/L, resulting in a BOD5 redu tion of about 90 percent. A low-labor waste tre ment system can be formed by allowing the oxi tion ditch liquor to overflow by gravity into a n overflow aerobic lagoon with a fluctuating dep The effluent is not suitable for direct discha into a stream, but may be spread on land in odorless state. Some obvious concerns of t system are: nitrates in the effluent disposed on field; possible consequences of high rates of ap cation to fields; nitrates, phosphates, and color the effluent if stream discharge were to be us and operating costs. PIERCED STEEL PLANKING SURFACING FOR FEEDLOT RUNOFF CONTROL,
South Dakota State Univ., Brookings. Water Resources Inst.
J. L. Wiersma, C. B. Gilbertson, J. M. Madden, R. E. Larson, and F. L. Schapler.
Paper No 73-4541 presented at 1973 Winter Meeting, American Society of Agricultural Engineers, December 11-14, 1973 Chicago, Illinois, 16 p, 17 fig, 17 ref.

Descriptors: *Feed lots, *Runoff, *Control, Waste water treatment, *Farm wastes, Cattle, Economics, Water pollution, Infiltration rates, Hogs, Design, Costs.
Identifiers: Pierced steel planking.

The concept of using pierced steel planking in a dish shaped feedlot with a porous surface on a sand bed to partially treat the liquids which had been separated from the solids proved unsatisfactory. It was unsatisfactory because the waste material from the cattle combined with hair to form an impermeable layer on the sand and this prevented vertical water movement. However, the pierced steel lot did show certain advantages over concrete lots. Some of these advantages were: the cattle adapted readily to the steel; the surface remained stable; the surface could be cleaned easily; the surface could be cleaned when concrete lots remained frozen; the lots were cooler than concrete lots during the warm months; the lots were dust free during dry seasons; and the lots could be easily remodeled by arranging the sections differently with a tractor. The price of the steel pierced lot varies as do other surfaces with each set of conditions. (Russell-East Central)

SETTLING BASIN DESIGN FOR RACEWAY FISH PRODUCTION SYSTEMS,
Georgia Univ., Athens. Agricultural Engineering Center.
J. L. Chesness, W. H. Poole, and T. K. Hill.
Paper No 74-5005 presented at the 1974 Annual Meeting of American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974, 13 p, 3 fig, 5 tab, 8 ref.

Descriptors: *Settling basins, *Design, *Organic wastes, Fish, *Sedimentation, Recirculated water, Model studies, Effluent, Analysis, *Waste treatment.
Identifiers: *Raceway fish production systems, *Fish wastes.

A new type of fish production system is a flowing water culture of fish in a recirculating earthen raceway. This system produces substantial amounts of fish, but if production in this closed-loop system is to continue, techniques must be found for the removal of waste products. This study was undertaken to: (1) determine the quantity of solids and the settling characteristics of suspended solids; and (2) design and test a settling basin for the removal of these solids. A trapezoidal-shaped settling basin was designed. Field evaluations showed that the basin would remove about 48% of the filterable solids. This was 82% of the predicted removal efficiency, but only 6% of the total organic solids would be removed by sedimentation. This study indicates that effective removal of waste organics in warm water fish culture recirculating raceway systems cannot be attained by physical sedimentation alone. (Russell-East Central)

LABORATORY STUDIES ON FEEDLOT RUNOFF,
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
L. R. Christensen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 676, $4.75 in paper copy, $2.25 in microfiche. MS Thesis, April, 1973, 77 p. 16 fig, 15 tab, 40 ref. OWRT A-027-NEB(1). 14-31-0001-3827.

Descriptors: *Farm wastes, Agricultural runoff, *Feedlots, Runoff, *Waste treatment, Coagulation, *Aeration, Chemical oxygen demand, Operations.

Laboratory studies, beginning in mid-September, 1971, and continuing through the summer of 1972, were made to determine the optimum operating conditions for an extended aeration system with air lift solids return. Treatment efficiencies were evaluated at relative equilibria of the monitoring parameters of MLSS, effluent SS, mixed liquor COD, effluent COD, and soluble effluent COD with respect to the influent waste COD and SS. Results showed that aerobic treatment with a forced solids return could operate at greater than 50 percent efficiency for both solids and COD removal at detention times as low as 2 days without additional treatment. It was concluded that feedlot runoff is amenable to aerobic treatment. (Cameron-East Central)

EVALUATION PROBLEM OF STORM WATER ROUTING MATHEMATICAL MODELS,
Societe Grenobloise d'Etude et d'Applications Hydrauliques (France).
J. A. Cunge.
Water Research, Vol 8, No 12, p 1083-1087, December 1974. 10 ref.

Descriptors: Evaluation, *Value engineering, *Mathematical models, Analytical techniques, Synthetic hydrology, Drainage systems, *Flood routing, *Storm water, *Sewers systems, *Storm drains.

The flood routing procedure is a key part of any mathematical model of a storm sewer system. Eventually the value of the whole model depends on it. The choice of the flood routing method among the several available should be made taking into account local situations and the ultimate aims of the simulation model. That decision may ultimately influence the sucess or failure of the actual sewer management system. Several alternative models were discussed. Municipal services should take an active part in any evaluation study as well as in the actual model building and calibrating. (Jess-ISWS)

LABORATORY STUDY OF CONTINUOUS ELECTROOXIDATION OF DILUTE CYANIDE WASTES,
Waterloo Univ. (Ontario). Dept. of Chemical Engineering.
J. J. Byerley, and K. Enns.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-235 588, $3.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Cincinnati, Ohio, Report EPA-670/2-74-059, p 39, October 1974. 5 fig, 27 ref, 3 append. EPA Project 12010 DOT.

Descriptors: *Industrial wastes, *Waste water treatment, *Chemical wastes, Water pollution control, Waste water disposal, Oxidation, Laboratory tests, *Electrochemistry, Water purification, Heavy metals, Water pollution sources.
Identifiers: *Cyanides, Metal finishing wastes, *Electrooxidation, Electroplating.

An experimental study was conducted to determine the feasibility of detoxifying dilute cyanide plating wastes by electrooxidation. Because of the toxicity of cyanide to aquatic and animal life and its detrimental effect on the operation of sewage treatment plants, in-plant treatment of dilute cyanide wastes is essential. Although successful processes have been developed for destroying cyanide in concentrated plating wastes, the economic feasibility of the electrolytic technique for treating dilute wastes has not been established. An electrochemical demonstration unit was developed for the treatment of dilute cyanide plating wastes. The cyanide and plating metal concentrations can be reduced to less than 1 ppm. Energy requirements vary according to the duty and mode of operation ranging from 40 KWhr to 140 KWhr/lbCN(-). (Humphreys-ISWS)

COMPREHENSIVE PLAN FOR WATER, SEWER AND STORM DRAINAGE IN THE LOWER RIO GRANDE VALLEY, (VOLUME II).
Nelson (B.L.) and Associates, Inc., Dallas, Tex.
Prepared for the Lower Rio Grande Valley Development Council, McAllen, Texas, September 1971. 112 p, 10 tab, 6 maps, 16 ref. HUD 701.

Descriptors: Water resources, *Water resources development, Flooding, *Drainage systems, Water management(Applied), *Rio Grande River, *Sewage, Waste water disposal, Channel improvement, *Comprehensive planning, Potential water supply, Regional development water poilcy, *Texas, Planning, Irrigation, *Storm drains.
Identifiers: Lower Rio Grande Valley(Tex), Cameron County(Tex), Hidalgo County(Tex), Willacy County(Tex).

This regional facilities plan has three sections: (1) outlines the existing situation for water, sewer and storm drainage facilities in each county, Cameron, Hidalgo, and Willacy, then describes the situations in individual communities; (2) discusses plans for both short range and long range development programs, including alternate means of financing; (3) suggests creation of a single Regional Authority to provide potable and irrigation water from the Rio Grande and recommends adoption of this plan. Water supply is primarily groundwater of mixed and mostly poor quality plus diversions from the Rio Grande River. Flooding from the Rio Grande combined with control and disposal of surface runoff creates serious problems. Drainage problems are so complex that comprehensive project type action is necessary. Many cities have outdated and inadequate sewage disposal systems with streams and ditches serving as residual waste carriers. For the short range period (5-10 years), increased water demands will necessitate highest priority being given to construction of water components where facilities are lacking or inadequate according to Health Department standards, establishment of regional sewage treatment subsystems, and construction of single-purpose and multi-purpose channels plus land treatment measures to protect and improve agricultural lands. In the long range (to 1990), water supply for domestic and industrial usage is expected to be a working combination of treated river water, treated well water, de-salinized water, re-cycled effluent, and imported water. Continued and systematic review of this Plan should be carried out to solve current problems and provide for future needs. (Hufschmidt-North Carolina)

ARE WE READY FOR A CLOSED SYSTEM OF WATER SUPPLY, TREATMENT, AND REUSE - TECHNOLOGY VS. PSYCHOLOGY,
Water Resources Bulletin, Vol 10, No 5, p 942-951, October, 1974. 4 tab, 6 ref.
J. C. Huang, and R. L. Smith, Jr.
Water Resources Bulletin, Vol 10, No 5, p 942-951, October, 1974. 4 tab, 6 ref.

Descriptors: Waste water treatment, Water management(Applied), *Potable water, *Psychological aspects, *Reclaimed water, Waste dilution, Attitudes, Water quality, Water utilization, Water consumption, *Water pollution, Recycling, Effluents, Environmental sanitation, Water purification, Water sources, Saline water, Treatment facilities, Domestic water, Public health, Africa, Technology, Water quality standards.
Identifiers: Psychological effects, Drinking water standards, Windhoek(S. Africa), South Africa.

Few totally closed systems of water supply, treatment, and reuse exist; in the United States, the Public Health Service discourages such practices. However, are there scientific reasons to support this disapproval, is psychological immaturity the factor, or are treatment technologies not yet available. In some arid areas or in island countries, direct resue of waste water is economically more attractive than desalination of ocean or brackish water. In Windhoek, South Africa, renovated waste water is used for drinking purposes and comprises 14% of the normal supply and over 40% of the supply in winter months. Technology exists to provide high quality effluent, through the use of lime and chlorine. Understanding of viral survival is still incomplete for some waste water treatment processes. Some scientists are also concerned about existing inadequate drinking water standards. Presently, much renovated waste water is first discharged into a receiving stream before it is withdrawn again for reuse; the stream then acts as a natural barrier. The public's psychological barriers still outweigh the technical credibility of reuse; education and encouragement are needed. (Grden-North Carolina)
W75-04761

COMPREHENSIVE WATER AND SEWER PLAN FOR ALAMANCE COUNTY, NORTH CAROLINA,
Freeman (William F.) Associates, High Point, N.C.
G. E. Freeman, H. B. Stokes, Jr., and C. J. Jones.
Prepared for Alamance County Board of Commissioners and Alamance County Planning Board. May, 1969. 46 p, 36 fig, 21 tab.

Descriptors: *Water supply, *Water sources, *Sewers, *Sewage, *Water supply development, Urbanization, Septic tanks, Combined sewers, Water resources, Water treatment, *North Carolina, Water requirements, Waste water treatment, *Comprehensive planning.
Identifiers: *Alamance County(N.C.), Haw River(N.C.).

Alamance County, in the Piedmont area of North Carolina, should construct an extensive water and sewer system to encourage continued growth. Major urban areas of Burlington, Graham, and their fringes with approximately half of the estimated population of 95,000 are excluded from the study area. Manufacturing in the county accounts for 71.9% of the labor force. Soil surveys show that over half of the county is not well suited for farming, and farming is a decreasing percentage of the county's income as the number of farms decreases. The rapid growth of a rural non-farm population is causing increased densities which are difficult to maintain on private wells and septic tanks, especially since over 50% of the soil in the county is poorly suited for septic tanks. In 1960, 12.8% of the dwelling units in the county had no piped water at all, and nearly 21% of the units were served by pits privys or had no toilet facilities. Existing water and sewer facilities are described for the half dozen area communities, including industrial plant systems which sell water to homes. Capacities and technologies in use are described. Water resources include poor ground water supplies and ample surface water, particularly the Haw River, which, with strict effluent controls, could be an important water source. Population projections indicate a need for an additional 10.4 million gallons per day by 1990. Needs in each community are outlined, and a $2.9 million project is proposed for water and sewer systems as a first phase of a more extensive system. (Herr-North Carolina)

RATIONAL BASIS FOR SEPTIC TANK SYSTEM DESIGN,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
R. Laak, K. A. Healy, and D. M. Hardisty.
Ground Water, Vol 12, No 6, p 348-351, November-December 1974. 2 fig, 17 ref.

Descriptors: *Design, *Septic tanks, *Domestic wastes, *Sewage disposal, *Soil disposal fields, Hydraulic design, Percolation, Leaching, Ion transport, Groundwater, Phosphates, Nitrates, Nutrient removal, Water pollution sources, Water quality.
Identifiers: Biological clogging mat.

About 17 million families in the United States are served by septic tank and subsurface seepage systems. Rational design of these disposal systems includes three aspects. First, the system must be hydraulically sound. The flow regime and the storage and water carrying capacity of the receiving soil should be measured before design. A soil with a coefficient of permeability less than 0.0001 ft/min suggests, for example, that the hydraulic capacity of the system governs the size of the subsurface leaching field. Seasonally high water tables or impervious strata may retard the flow and reduce the quantity of wastewater that can be carried away from the subsurface disposal area. In this case an elevated bed can be designed to increase the potential hydraulic gradient. The second consideration concerns the biological mat in leaching fields. Leaching fields can be designed with higher loadings in soils having a coefficient of permeability greater than 0.0001 ft/min if increased pretreatment is used. A mathematical relationship was developed for reducng the size of leaching fields for effluents with a BOD5 plus suspended solids less than 250 mg/l. Leaching fields were projected to operate indefinitely. Long-term loading rates for different soil permeabilities were plotted on a graph that can be used for sizing fields. The third consideration concerns preservation of the groundwater quality. Concrete sand and silt with an unsaturated thickness of 1.5 feet still removed after 2 years of operation 30% of septic tank effluent phosphate and nitrogen. The effluent from the test soils had a concentration of about 13 mg/l phosphate and 15 mg/l nitrogen mostly in the NO3-N form. (Gibb-ISWS)

HYDRAULIC ANALYSIS OF WINNIPEG SUMP INLETS,
Manitoba Univ., Winnipeg. Dept. of Civil Engineering.
K. M. Adam, and N. B. Brandson.
Journal Water Pollution Control Federation, Vol 46, No 12, p 2755-2763, December 1974. 7 fig, 4 ref, 1 append.

Descriptors: *Intakes, *Design data, *Discharge coefficient, *Laboratory tests, Discharge(Water), Storm water, Hydraulics, Storm drains, Urban runoff, Measurement, *Canada, Flow, Slopes, Weirs.
Identifiers: *Street drainage, Curb inlets, Gutter inlets, *Winnipeg(Manitoba).

Full-scale tests were run on a model of inlets of the types installed in the city of Winnipeg, Manitoba. The four types of inlets tested were the undepressed curb inlet, the depressed curb inlet, the undepressed gutter inlet, and the undepressed combination inlet. All tests were for the 'sump condition' or inlets located at the low point of a sag vertical curve. Gutter slope was varied for each case. The discharge data for each case was empirically fitted to an equation of the form Q equals C times y to the n power. Values of C and n were presented graphically as functions of the gutter slope for each inlet type. Comparisons with previous studies were also made and discussed. (Adams-ISWS)

Identifiers: Pressure distribution system.

The function of a septic tank-soil absorption system is to purify the wastewater discharged from the home before reaching the groundwater. However, failure often occurs in the soil absorption field. Failure can originate from two causes: (1) inadequate infiltration of effluent into the soil and (2) inadequate purification in the soil during percolation because of short travel times. Failure of the second type can be prevented through proper design and operation of the soil absorption field. Uniform distribution of the septic tank effluent over the entire soil absorption field is necessary to maintain the soil's efficiency for pathogenic organism removal. (Gibb-ISWS)

PRECOAT FILTRATION ON ROTARY VACUUM FILTER (PRECOAT-FILTRATION AUF DEM VAKUUM-TROMMELFILTER),
H. Berndt.
Aufbereitungstechnik, Vol 15, No 3, p 137-140, November 3, 1974. 5 fig, 11 ref. (English Summary).

Descriptors: *Filtration, *Waste water treatment, Separation techniques, *Filters, Water treatment.
Identifiers: *Precoat filters, *Rotary vacuum filter, Filter cake removing device, Stationary filter tanks, Filter drums.

A pre-coat filter, which was developed from the rotary vacuum filter, operates continuously to filter suspensions by utilization of gas pressure. The filter includes the stationary filter tank where

the suspension is introduced, the filter drum, provided with filter cells subdivided by the chamber division strips, the control valve, the swinging agitator, the filter cake removing device, and the driving mechanism. The pre-coat filter may consist of various materials. A detailed description of the pre-coat filtration process is presented. Pre-coat filtration on the rotary vacuum filter permits the separation of suspensions which are unable to be separated into the solid and liquid phase by other conventional continuous filtration processes. TERTIARY TREATMENT: THE WRONG SOLUTION TO A NON-PROBLEM,
Las Virgenes Municipal Water District, Calabasas, Calif.
H. W. Stokes, and L. D. Hedenland.
Civil Engineering-ASCE, Vol 44, No 9, p 86-89, September, 1974. 1 fig.

Descriptors: *Waste water treatment, *Activated sludge, *Tertiary treatment, *Design criteria, *Operation and maintenance, Biochemical oxygen demand, Treatment facilities, Suspended solids, Heavy metals, Nutrient removal, Water quality control, Biological treatment, Nitrogen, Phosphorus removal, Bacteria, Viruses.

Design criteria and operating techniques are suggested that allow higher levels of BOD removal than those generally thought to be possible with activated sludge treatment. The Tapia Water Reclamation Plant, California, reliably achieves 98 percent BOD and suspended solids removal by optimizing the secondary treatment. The process design for this plant is given. It covers: primary treatment; aeration system; process air requirements; secondary sedimentation tanks; chlorine contact tanks; reaeration tanks; aerobic digestion; and, designed effluent quality criteria. The most important parameters for precise operation are aeration control through the use of nitrate nitrogen profiles, precise daily solids balance of the aeration system, and constant activated-sludge return rate. A secondary sludge plant that can produce 98 percent BOD removal and nitrify the ammonia, will have an effluent that contains almost no colloidal material, should not need filtering, and will have a turbidity of less than one Jackson Unit. A properly designed and operated secondary treatment (activated sludge) plant can adequately remove suspended solids, BOD, ammonia, coliform, and virus. Tertiary treatment is needed only to remove the heavy metals, phosphorus and nitrate-nitrogen. (Orr-FIRL)

AMMONIA DESORPTION BY DIFFUSED AERATION,
Cornell Univ., Ithaca, N.Y. Agricultural Waste Management Program.
E. G. Srinath, and R. C. Loehr.
Journal Water Pollution Control Federation, Vol. 46, No 8, p 1937-1957, August, 1974. 12 fig, 2 tab, 18 ref.

Descriptors: *Nitrogen, *Aeration, *Waste water treatment, Ammonia, *Waste water(Pollution), Air-water interfaces, Temperature, Viscosity, Mathematical models, Hydrogen ion concentration.
Identifiers: *Ammonia desorption.

The removal of nitrogen from waste water is becoming increasingly important. Since nitrogen in untreated waste water exists as ammonium nitrogen, ammonia desorption is a viable method of nitrogen control. Theoretical considerations to predict ammonia desorption from water and waste water, experiments on removal of ammonia from waste water by diffused aeration, and predictive equations relating ammonia desorption efficiency to environmental and process conditions are discussed. The quantity of ammonia desorbed from a solution depends on the concentration of undissociated ammonia, the gas-liquid surface area, the mass-transfer coefficient, and the partial pressure exerted by ammonia in the gas phase. The rate of diffusion is influenced by pH, temperature, and viscosity. The equations presented allow better estimates of the ammonia loss from artificial and natural aerated systems to be made. Equations were developed to determine the ammonia desorption coefficient under quiescent and aerated conditions and to determine the quantity of ammonia lost under various environmental conditions. BUBBLE SIZE AND CONTACT TIME IN DIFFUSED AERATION SYSTEMS,
Windsor Univ. (Ontario). Dept. of Civil Engineering.
D. S. Mavinic, and J. K. Bewtra.
Journal Water Pollution Control Federation, Vol 46, No 9, p 2129-2137, September 1974. 7 fig, 4 ref.

Descriptors: *Aerobic treatment, *Bubbles, *Activated sludge, *Aerated lagoons, *Aeration, Sewage treatment, *Waste water treatment, Flow, Water circulation, Pumping.

One of the most common ways of supplying oxygen to aeration basins is by diffused bubble aeration. The contact time of air bubbles with the liquid is one of the most important parameters influencing the efficiency of diffused bubble aeration. The procedure for determining bubble contact time, ways to increase this time, and the effects of different parameters on this time are discussed. Four systems were observed: a simple column of water; water circulation and an upward cocurrent air-water flow caused by diffused air; water circulation and counter-current air-water flow caused by pumping; and, water circulation and downward cocurrent air-water flow caused by pumping. The unit contact time in each system was dependent on the air flow rate and the unit contact time decreased with an increase in air flow. The unit contact time is independent of the depth for the first three systems. The total contact time will increase almost linearly with the diffuser submergence. System three (water circulation and counter-current air flow caused by pumping) provides the highest unit contact time. This is caused by the slowing of the air bubbles by countercurrent air-water flow. (Orr-FIRL)

APPLICABILITY OF CONTROL STRATEGIES TO THE ACTIVATED SLUDGE WASTEWATER TREATMENT PROCESS,
Purdue Univ., Lafayette, Ind.
R. F. Lech.
PhD Thesis, 1973, 279 p.

Descriptors: *Activated sludge, *Waste water treatment, Evaluation, *Model studies, *Control systems, *Performance, Design criteria.
Identifiers: Feedforward, Feedback.

The potential improvements to be gained by the addition of control systems to the activated sludge waste water treatment process are evaluated. Approximate models for the important transfer functions in the process are developed. The applicability of single and multiple-loop feedback control systems is evaluated on activated sludge plants characterized by two types of final settler behavior. The most significant improvement in performance is achieved by feedforward and combinations of feedforward and feedback control systems among all the control systems considered. The applicability of control strategies is limited by the design of the process. (Sandoski-FIRL)

SEWAGE TREATMENT IN THE POTTERIES,
Taylor (John) and Sons (England).
P. A. Banks.
The Consulting Engineer, Vol 38, No 7, p 41, 44, 45, July 1974. 4 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Water pollution, *Water quality management, *Municipal water, Industrial wastes, Effluent control, Rivers, Coal mine wastes.
Identifiers: *Preliminary treatment, Link sewer, Clay pits, Slag heaps.

At Stoke-on-Trent, Great Britain, a new sewage treatment plant is being completed to help the redevelopment of Stoke into a city with an expanded economy with a larger range of social and municipal services. The reclamation work on derelict clay pits and slag heaps has fostered redevelopment in industrial towns within their boundaries. The Strongford sewage works on the River Trent is an extension of a plant first constructed on the southern city boundary in 1930. A policy of centralization of sewage treatment resulted in the reduction of the number of works maintained in the general area and the transfer of flow to Strongford. The plan to close the Hanley works and three other smaller works necessitated a sewer 2 m in diameter for the transfer of up to six times the dry weather flow 5 miles south. A scheme to route the link sewer was developed according to an assessment of the subsidence risk arising from two active coal mines in that area. The works require a high effluent standard, including preliminary treatment units and primary sedimentation arranged in two inter-connected streams. (Leibowitz-FIRL)

ACTIVATED SLUDGE BULKING (IN JAPANESE),
K. Sona, and S. Kyushin.
Kemikaru Enjiniyaringu, Vol 19, No 7, p 37-41, July 1974. 6 fig, 2 tab, 12 ref.

Descriptors: *Activated sludge, *Bulk density, *Settling basins, Nutrients, Biochemical oxygen demand, Chlorination, Pre-treatment, Temperature, *Waste water treatment.
Identifiers: *Bulking, Mixed liquor suspended solids(MLSS).

The sedimentation ability of activated sludge and bulking, the causes of bulking, the hypothetical mechanism of filamentous bulking, and countermeasures for bulking are discussed. In an operating aeration tank, the maintaining of MLS (mixed liquor suspended solid) concentration at an appropriate level and the BOD load at a relatively low level (usually less than 0.3 kg BOD/kg MLSS/day) is important. The ratio of nutrients in the sludge is important, and if the ratio of carbon/nitrogen increases, the amount of carbohydrates in bacteria will increase; one way of preventing bulking is to add enough nitrogen. Chlorine is deleterious to filamentous fungi rather than to Zoogloea, and the addition of about 0.3-0.6 percent (to dry sludge weight) in the return sludge can improve the settling of bulking sludge greatly. To prevent other deleterious effects, chlorine

must be carefully measured. Intermittent adding of other oxidizing agents such as hydrogen peroxide is reported to be effective; the limits are 20-400 ppm, but less than 20 ppm will be ineffective and over 400 ppm will cause partial deflocculation. Radical changes in the quantity and composition of waste water flow will induce bulking; for this reason, a pre-treatment of water is desirable. The type of pre-treatment will affect the efficiency of activated sludge greatly. The low temperature of aeration tank water can cause bulking both by an increase of carbohydrate at a lower temperature. An intermittent fill and draw method of waste water flow has been successful in preventing bulking. (Seigle-FIRL)

COAGULATION-FILTRATION PRACTICE AS RELATED TO RESEARCH.
American Water Works Association, New York. Committee on Research.
Journal of the American Water Works Association, Vol. 66, No. 8, P 502-503, August 1974. 24 ref.

Descriptors: *Coagulation, *Filtration, *Flocculation, *Sedimentation, Water pollution, *Water treatment, Algae, Activated carbon, Turbidity, Zeta potential, *Waste water treatment.
Identifiers: *Filterability tests, Pilot-filter monitoring, Residual-coagulant analysis, Electrophoretic mobility, Jar test.

In the field of water treatment, clarification generally means the solids-liquid separation process which may include coagulation, flocculation, sedimentation, and filtration. Filtration is merely one step in the total process. The laboratory jar test is the conventional method for determining the optimum coagulent dosage for plant operation. Plants with expert staff may also employ zeta potential measurements, filterability test, pilot-filter monitoring, residual-coagulant analyses, or interfacial-turbidity monitoring. The jar test is limited because of the subjective nature of the floc evaluation and the difficulty of duplicating conditions of water being treated in a plant. The filterability of a floc is a measurable property of the raw water, the equipment, or the floc itself. Iron flocs filter best near the isoelectric point of the floc. The efficiency of removal of negatively charged clay particles was improved by charging the surface of sand columns electropositively. The turbidity removal improves with increased electrophoretic mobility of suspended clay materials; coagulating chemicals are required in the influent to a filter for the removal of algae and particles of activated carbon. (Leibowitz-FIRL)

SOLID ADSORBENTS FOR GAS AND LIQUID TREATMENT,
Grace (W.R.) Australia Ltd., Melbourne. Davidson Chemicals Div.
P. E. Pick.
Process and Chemical Engineering (PACE), Vol 27, No 6, p 23-27, June, 1974. 3 fig, 2 tab.

Descriptors: *Silica gels, Gases, *Liquid wastes, *Separation techniques, Purification, *Dehydration, Ziolites, Water pollution, *Waste water treatment.
Identifiers: *Solid adsorbents, *Gas and liquid treatment, Silicon dioxide, Amorphous polymeric structures, Extrusion process, Molecular sieves.

Solid adsorbents such as silica gel and the synthetic or naturally occurring zeolites called molecular sieves can be utilized in the purification, separation and dehydration of gases and liquids. Davison gel, a pure form of silicon dioxide (99.7 percent SiO_2), which is made under carefully controlled conditions from sulphuric acid and sodium silicate results in an amorphous polymeric structure with the following percentage composition: Si as SiO_2, 99.7; Fe as Fe_2O_3, 0.03; Al as Al_2O_3, 0.10; Ti as TiO_2, 0.09; Ca as CaO, 0.01; Na as Na_2O, 0.02; Zr as ZrO_2, 0.01; trace elements, 0.03. This structure consists of beads with pores with a diameter ranging from 20-40 A. The pore size and particle sizes can be determined by controlling the reaction conditions during their manufacture, with the granules being sieved into particle-size ranges. An extrusion process is used in the formation of bead form silica gel. The result is a pure, chemically inert material which is structurally strong with a high attrition resistance. The total surface area will range around 700-800 sq m/g, depending upon pore size. Silica gel has a great affinity for water, and can hold 40-100 percent of its weight as water. It can adsorb organic molecules, with the selectivity order based on polarisability, degree of unsaturation and volatility. This gel can be utilized in the dehydration of air, carbon dioxide, natural gas, alcohol mixtures, aromatics like benzene, and for chromatographically separating organic fractions. (Leibowitz-FIRL)
W75-04826

ENVIRONMENT, ENERGY COSTS SUGGEST OXYGEN ACTIVATED SLUDGE AS WASTE-WATER TREATMENT APPROACH,
R. J. Kulperger.
Professional Engineer, Vol 44, No 10, p 29-31, October, 1974. 4 fig.

Descriptors: Activated sludge, *Oxygenation, *Aeration, Costs, Energy, Power, Dissolved oxygen, Secondary treatment, *Waste water treatment.
Identifiers: *UNOX System.

The UNOX System technology for an oxygen-activated sludge system for waste water treatment is currently used by 125 treatment plants in several countries. The system consists of a covered, staged aeration or oxygenation basin where oxygen rather than air is used as the aerating gas. Feed oxygen, waste water and return sludge all flow through the basins in the same direction. High dissolved oxygen levels (4 to 8 mg/liter) and high solids levels (4000 to 8000 mg/liter) are maintained in the oxygenation basin. Treatment time is reduced and the system possesses high stability to shock organic loads. The costs of energy and power in recent years have escalated, and the UNOX System has an economic advantage in terms of power usage. Total power to operate an oxygen activated sludge system compared to a diffused air system will be reduced from 30 to 50 percent. For example, in Detroit, Michigan, both types of plants are operated and the relative annual operating costs of the UNOX System showed a savings of $311,500 per year, most of which is the result of reduced power usage. In addition, the ability of a system to turn down in response to organic loads imposed on the plant is an important factor, relative to power usage. The typical UNOX System reduces average consumption by 20 percent, calculated by the early design years of a plant plus diurnal variations at full plant load. At 1.5 cents per KWH, 100 Hp costs over $10,000 per year. The amount of land required for oxygen-activated sludge systems is also less than that of air diffusion systems because of the reduced sewage residence time. The residence time is reduced because of the high mixed liquor concentrations maintained in oxygenation basins. With increases in power costs, and decreases in available land, this method is a viable alternative to traditional air systems for secondary waste water treatment. (Prague-FIRL)

UPDATING AGING SEWERS WITHOUT TRENCHING,
Cliffside Pipelayers, Scarborough (Ontario).
H. S. St. Onge.
Engineering and Contract Record, Vol 87, No 7, p 40-41, 44, July, 1974.

Descriptors: *Sewers, *Plastic pipes, Pipelines, Materials, Construction, Maintenance, *Canada, Waste water treatment.
Identifiers: *Reaming, Pipe repairs.

Technology for sewer renewal without excavation costs less, avoids public nuisance such as construction noise and inconvenience, and prevents problems of damage to gas and water lines. Major causes of trouble in sewers are protruding laterals, calcite buildup, and root infestation obstructions which reduce cross-sectional area and produce turbulent flow, as well as deterioration of the pipe walls. In the city of Toronto, a reaming operation was designed to increase pipe flow capacity by first removing obstructions. Renewal is effected by using inserted close-tolerance polyethylene pipe. A video-reaming technique was successful; the operator of the reamer could observe, on closed circuit television, the size and shape of objects encountered in order to pull and cut with the proper amount of pressure. Once reaming is complete, the length of sewer is cleaned with a high pressure jet spray vehicle; the close fitting pipe is pulled by a vibrating nose cone; and the plastic liner is inserted by means of a hydraulic power winch truck positioned over a manhole. A final process involves remote lateral cutting and grouting to insure leakproof connections. (Prague-FIRL)

MORE THAN A MYRIAD.
Engineers Notebook, No 173, p 355-356, August, 1973.

Descriptors: *Waste water treatment, *Outfall sewers, *Municipal wastes, Waste treatment, Construction, Pipes, Materials, Equipment, Installation, Concrete pipes, *Australia.
Identifiers: Neoprene joint seals, Melbourne(Aust).

The metropolitan sewage system of Melbourne, Australia has been expanded to include a modern waste treatment plant southeast of the city. As part of the pollution controls, an effluent outfall line was constructed to discharge purified effluent from the plant to the ocean. Construction of this line involved 35 miles of trenching, manufacture of an equivalent length of large-diameter concrete pipe sections, installation, backfilling, and landscaping. Joint seals of Neoprene for the 90 to 100 inch diameter outfall pipe sections were chosen because of Neoprene properties of long-term retention of resilience and sealing integrity. Special pipe sections were designed where topography necessitated bends in the line. When the system is fully operable, it will serve 175 square miles and handle 50 million gallons of waste water per day. (Prague-FIRL)

KINETICS IN OZONE TREATMENT OF SECONDARY SEWAGE EFFLUENTS, (IN JAPANESE),
T. Goda, O. Kawahara, and M. Eda.
Gesuido Kyokai-shi, Vol 11, No 123, p 41-49, August, 1974. 20 fig, 3 ref.

Descriptors: *Ozone, *Sewage treatment, Effluents, Models, Biochemical oxygen demand, Chemical oxygen demand, Absorption, Filters, Measurement, *Waste water treatment.
Identifiers: *Japan, COD removal.

The absorption of ozone in water, the autodegradation of ozone, and the oxidation of ozone are some phenomena not yet satisfactorily explained. As a basic study for the ozone treatment of secondary treatment liquid waste, the question of kinetics was examined. The experimental apparatus consisted of a batch bubble tower which was made of an acryl cylinder with a glass filter at the bottom where ozone from the ozone producer was supplied. The liquid an

ozone were contacted there. The emitted ozone was measured between the bubble tower and emission exit. The test liquid sample was taken every hour for 24 hours from the secondary treatment water of a Kyoto sewage treatment plant; from four time belts, equal amounts were taken and a composite test material was prepared. The water was filtered to remove suspended substances before the ozone treatment. The measurements were taken for BOD5, COD(Cr), COD(Cr) removal speed, ozone consumption/COD removal, and BOD5/COD(Cr). The COD(Cr) removal process was satisfactorily explained by a hypothetical model for multiple reactions of different speeds and an equation induced from COD removal speed data. The relationship between ozone consumption and COD removal was experimentally confirmed to be about 2, and the ratio increase with the progress of treatment was theretically clarified. The initial five minutes of BOD5 increase had a correlation with COD(Cr) removal. (Seigle-FIRL)

SYMPOSIUM ON ANIMAL WASTE MANAGEMENT.
Held at USDA Southwestern Great Plains Research Center, Bushland, Texas, January 18, 1973. 50 p, (1973), 11 fig, 8 tab, 21 ref.

Descriptors: *Farm wastes, *Waste water treatment, *Waste disposal, Recycling, Feed lots, Cattle, Nutrients, Nitrogen, Salts.
Identifiers: *Land spreading.

This symposium was held to consider the problems of animal waste management, particularly in relation to beef cattle. Animal waste treatment and disposal were discussed in terms of recycling and land disposal. Various forms of recycling, i.e., refeeding, creating fuels, etc., are still largely experimental and in most cases are not yet feasible. While land spreading offers a much used means of waste disposal, over-supply of nutrients in the soil is a possible hazard. Research is still needed for development of non-polluting feasible means of disposing of animal wastes. (See W75-04833 thru W75-04836) (Merryman-East Central)
W75-04832

EFFECTS OF CATTLE FEEDLOT MANURE ON CROP YIELDS AND SOIL CONDITIONS,
Southwestern Great Plains Research Center, Bushland, Tex.
A. C. Mathers, B. A. Stewart, J. D. Thomas, and B. J. Blair.
In: Symposium on Animal Waste Management, held at USDA Southwestern Great Plains Research Center, Bushland, Texas, January 18, 1973, p 1-13, (1973). 6 fig, 1 tab.

Descriptors: *Feed lots, *Cattle, *Farm wastes, *Waste disposal, *Crops, Nitrogen, Salts, Rates of application, Soil profile.
Identifiers: *Soil conditions, Land spreading.

One to three years data suggest that manuare applications of ten tons per acre furnish adequate nitrogen for most crops without creating high salt buildup in the soil. Also, applications of ten tons per acre do not affect organic levels of the soil. Higher rates of manure can be added to soil without lowering yields, but nitrate and salts accumulate, eventually hampering crop yields. This problem can usually be alleviated by deeper plowing depths. At just ten tons per acre, land area in even the most concentrated feeding areas is adequate to dispose of manure. In fact, only one-fourth of the grain sorghum cropland in Texas long would have to be treated to dispose of the manure. The challenge is to develop distributing and handling systems to spread the manure on croplands most beneficially. (See also W75-04832) (Russel-East Central)
W75-04833

EFFECT OF RATION ON MANURE SALT CONTENT,
Texas Tech Univ. Center at Amarillo, Pantex.
R. H. Klett.
In: Symposium on Animal Waste Management, held at USDA Southwestern Great Plains Research Center, Bushland, Texas, January 18, 1973, p 26-31, (1973). 2 tab, 8 ref.

Descriptors: *Diet, *Salts, *Farm wastes, Cattle, Livestock, Feed lots, Performance, Waste treatment, Water pollution sources.
Identifiers: Ration, *Waste management, Sodium levels, Excretion.

Experimental data illustrate that excessive levels of salt obtained from the diet are excreted and tend to serve no useful purpose for the nutrition of feedlot steers. Data also suggest that levels of sodium in the form of NaCL could be reduced below those normally recommended for feedlot rations without effect on annual performance. In other words, the correct amount of salt is the amount that is utilized by the animal. The excess salt serves no useful function. Also, reducing feeding levels of salt will result in lower levels of salt in solid-waste and will allow higher incorporation of manure into the soil as fertilizing material. (See also W75-04832) (Russel-East Central)
W75-04834

AMOUNTS, COMPOSITION, AND MANAGEMENT OF FEEDLOT RUNOFF,
Southwestern Great Plains Research Center, Bushland, Tex.
R. N. Clark, and B. A. Stewart.
In: Symposium on Animal Waste Management, held at USDA Southwestern Great Plains Research Center, Bushland, Texas, January 18, 1973, p 32-42, (1973). 3 fig, 2 tab, 6 ref.

Descriptors: *Runoff, *Feed lots, Chemical composition, Sampling, Seepage, Evaporation, Stocking, Moisture content, Playas, Salinity, Irrigation, *Management, Waste treatment.
Identifiers: *Waste management.

Runoff amounts and concentrations were measured from a Texas High Plains cattle feedlot at Bushland. The graphic relationship between rainfall and runoff for runoff-producing storms was linear with about one-third of the rainfall ending up as runoff. Concentrations of runoff constituents were higher than those found for cattle feedlots elsewhere. This was probably due to high evaporation and high stocking rates which result in lots containing more salt. Soil moisture samples indicated that there was no significant seepage which would pollute ground water from playas or lots. Before runoff could be used for irrigation there would have to be a dilution of about four parts well water to one part feedlot runoff. This dilution would reduce salinity below levels hazardous to crops. Any use of feedlot runoff for irrigation required a close watch on salts in the water and soil. (See also W75-04832) (Russel-East Central)

FUTURE DEVELOPMENTS IN FEEDLOT WASTE MANAGEMENT,
Texas Agricultural Extension Service, College Station.
J. M. Sweeten.
In: Symposium on Animal Waste Management, held at USDA Southwestern Great Plains Research Center, Bushland, Texas, January 18, 1973, p 43-50, (1973). 7 ref.

Descriptors: *Feed lots, *Farm wastes, Water pollution, Recycling, Fuels, Oxidation, Odor, Runoff, Air pollution, Design, Slurries, Legal aspects, Waste treatment.
Identifiers: *Waste management, Land disposal, Refeeding, Pyrolysis, Composting, Soil conditioners.

With rapid progress being made toward abating water pollution and with the benefits and safety of land disposal of feedlot manure, remaining problems of feedlot waste management will primarily entail developing more efficient and odor-free methods of managing solid manure and polluted runoff. Recycling waste as feed offers one method, but the Food and Drug Administration has banned this method for lack of research. Many other recycling methods such as developing manure into fuel oil have been suggested. But, at the present, these methods are economically unfeasible. Perhaps one of the most restricting problems of waste management is odor. This problem has a variety of possible solutions, but most incorporate improved feedlot design. Once the problems have been satisfactorily solved or bypassed, feedlot waste management will no longer be a pollution control issue but an economic one. (See also W75-04832) (Russel-East Central)
W75-04836

MECHANICAL AERATION OF A WASTE DISPOSAL MANURE PIT,
L. V. Ellis, and R. M. George.
Paper No 73-5545 presented at 1973 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-14, 1973, 6 p. 2 fig, 4 ref.

Descriptors: *Aeration, *Waste treatment, *Waste disposal, Mechanical equipment, Liquid wastes, Odor, Costs, Waste storage.
Identifiers: *Milking machine compressor.

A swine producer in Johnson County, Missouri uses a milking machine compressor unit to bubble air through the liquid manure holding pits. Complete design for the system is given. The final results of this experiment are not known at this time, but the producer wants to continue with this system of aerating his manure pits. Offensive odors have been greatly reduced in the pits, the building, and from the effluent when it is spread on fields. The solids in the pits are broken up and held in suspension. Good response in the form of plant growth, was obtained when the manure was spread on fields. Operating costs are small; electricity costs about 3 cents an hour. If the unit operates for 16 hours in 24 hours, the cost is about 48 cents per day. (Cartmell-East Central)

5F. Water Treatment and Quality Alteration

INSTRUMENTATION IMPROVES WATER TREATMENT PLANT OPERATION,
Water and Sewage Works, Vol 121, No 6, p 96-99, June, 1974. 1 fig, 4 tab.

Descriptors: *Instrumentation, *Water analysis, *Optimization, *Operations, *Costs, Performance, Testing, Turbidity, Color, Hydrogen ion concentration, Spectrophotometry, Colorado.
Identifiers: Jar tests, Loveland(Colo).

Water analysis at the Loveland, Colorado water plant used jar tests in conjunction with a laboratory turbidimeter and a very sensitive spectrophotometer to indicate optimum operation and lowest overall costs. Clarification equipment, load conditions, and key water quality tests, such as turbidity, color, and pH, were studied most. The data were then examined for cause and effect relationships which suggested optimum feed rates or equipment changes. (Sandoski-FIRL)

COMPUTER CONTROL OF CHEMICAL ADDITION AT A WATER-TREATMENT PLANT,
Autocon Industries, St. Paul, Minn.
A. W. Manning.
Journal of the American Water Works Association, Vol 65, No 7, p 498-503, July 1973. 12 fig.

Descriptors: *Water treatment, *Automation, *Control, Digital computers, *Chemicals, Flow rates, Statistical methods, Algorithms, Regression analysis, Computer models, Iowa, Rivers, *Water quality control, Turbidity, Water temperature, Costs, Alkalinity, Variability, Mathematical models, Systems analysis, *Treatment facilities.
Identifiers: Sensors, Chemical feed, Water intake, Historical data, Raw water, Volumetric feeder.

In today's semiautomated water treatment plants, chemical feed is based primarily on one variable-flow rate. This method usually proves inaccurate and wasteful of expensive chemicals. The more desirable solution to this problem is complete automation of the dose rate based upon accurate information provided by on-line sensors that measure varying chemical constituents of water. A computer controlled system developed for such a facility at an Iowa City water treatment plant is described. The lack of adequate sensors has up to now delayed the use of computers for process control in water treatment. Iowa City has chosen a medium-scale digital computer which, through input-output multiplexing, automatically processes sensor inputs of varying water quality at the central processor unit. The Iowa City treatment system, which consists of two separate plants and a third under construction to contain the computerized control system, is described. Pertinent chemicals, sensors and control concepts are considered. A mathematical modeling approach based on multiple linear regression analysis of all available data is described. This method, combined with a manual input approach, offers the most flexibility. (Bell-Cornell)

TURBIDITY REMOVAL USING POLYMERS AND ACTIVATED CARBON,
Purdue Univ., Lafayette, Ind.
R. D. Miller.
PhD Thesis, 1973, 163 p.

Descriptors: Turbidity, *Polymers, *Coagulation, *Adsorption, *Activated carbon, Waste water treatment, *Water treatment.
Identifiers: *Turbidity removal, Coagulation-adsorption processes.

A possible coagulation-adsorption process for turbidity removal has been investigated. For clay destabilization using only polycations, optimum clarity was achieved over a narrow range of polymer dosages. Residual polymer concentrations below one mg/liter were determined for polycations using clay coagulation tests and for polyanions and nonionic polymers using a filtering technique. Combined use of carbon and polycations for clay removal was inferior to the use of polycations alone. Use of carbon and polyanions or nonionic polymers for clay removal produced some clarity at relatively low carbon dosages and nearly complete clarity at carbon dosages of 5.0 g/liter or higher with a mixing time of thirty minutes and settling time of ten minutes. VIROLOGICAL STUDIES IN WATER SYSTEMS: NATURAL OCCURRENCE OF REOVIRUSES AND THEIR INACTIVATION BY PHYSICAL AND CHEMICAL AGENTS,
Iowa Univ., Iowa City.
S. C. Mehta.
PhD Thesis, 1973, 105 p.

Descriptors: *On-site investigations, *Viruses, Water samples, Evaluation, *Iowa, *Water treatment, Waste water treatment, Pollutant identification.
Identifiers: *Reoviruses, Viral resistance, Coralville Reservoir(Iowa), Iowa River(Iowa), Cedar River(Iowa).

Field investigations of two water systems were undertaken to evaluate the detection of reoviruses in water samples collected from the Coralville Reservoir, Iowa River, and the Cedar River. A two-phase separation method was used to concentrate the viruses from the water samples. L cells and KB cells were used to propagate the virus. Immunofluosrescent staining was employed to identify the viruses. Reovirus was resistant to heat, less resistant to ultraviolet, and least resistant to chlorine and ozone. A comparison of resistance to inactivation between reoviruses and polio and coxsackie viruses exposed to various physical and chemical agents also is presented. (Sandoski-FIRL)

THE EFFECT OF LARGE APPLICATIONS OF MANURE ON MOVEMENT OF NITRATE AND CARBON IN AN IRRIGATED DESERT SOIL,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
B. D. Meek, A. J. MacKenzie, T. J. Donovan, and W. F. Spencer.
Journal of Environmental Quality, Vol 3, No 3, p 253-258, July-September, 1974. 3 tab, 9 fig, 8 refs.

Descriptors: *Nitrates, *Irrigated land, *Soil profile, *Groundwater, *Water pollution, *Leaching, *Denitrification, Feed lots, Deserts, Irrigation, Carbon, Manganese, Soils, Infiltration, Soil water.
Identifiers: Manure, Irrigation schedule.

As a practical solution for disposing of large quantities of manure from feedlots, the manure is being applied at high rates on agricultural lands as an inexpensive means of disposal. In areas where there is sufficient water for leaching there is a high potential for large amounts of nitrate to reach the groundwater of the area. Results indicate that it is possible to adjust manure application rates and irrigation schedules for fine textured desert soils so that very little nitrate will be leached below the root zone. To accomplish this and achieve good crop production it is necessary to adjust the two factors to insure that the surface soil is aerobic while a reducing zone is maintained in the subsoil. Movement of soluble organic carbon into the lower soil profile is an important factor in devloping reducing zones. Manganese in the soil solution is a useful parameter for defining zones where denitrification may occur in this soil type. (Mastic-Arizona)

STUDIES ON THE EFFECTIVENESS OF THE GUPPY POECILIA RETICULATA IN CONTROLLING CULEX PIPIENS S.L.:I. LABORATORY EXPERIMENTS ON PREDATION BEHAVIOR, (IN JAPANESE),
Tokyo Univ. (Japan). Dept. of Parasitology.
T. Kurihara.
Jap J Sanit Zool. Vol 24, No 1, p 73-77. 1973 Illus.
Identifiers: Fish behavior, Culex-pipiens, Food, Guppy, Laboratory, *Poecilia-reticulata, *Predation, *Mosquito larvae, Water pollution control, Fish foods.

The guppy P. reticulata is an effective predator of mosquito larvae. Predation efficiency was studied under laboratory conditions. Observations were made on the predatory activity of guppies on

pupae are larvae. These studies were carried out to develop more effective utilization of the guppy for C. pipiens control. Two guppies were placed in each aquarium containing 2 l of water and maintained at constant laboratory temperature of 26C and 600 lx illumination. Known numbers of larvae were introduced into each aquarium at 10:00 am every morning. The number of larvae eaten within a 2-h period increased when the prey population increased from 50-100. However, the number of larvae eaten was more or less constant when the prey was more than 100. Similar results were obtained when 0.7 g of powdered laboratory animal food was introduced into each container along with the mosquito larvae. The number of larvae eaten by the guppies under condition of high larval population plus the powdered food did not show any significant difference as compared with the number of larvae consumed at high larval density and without the powdered laboratory food. When the guppy population was increased and the larvae supplied were at the ratio of 50 larvae/guppy, there were more larvae consumed/guppy under high guppy population than under lower guppy population. Guppy attack mosquito pupae actively when the guppy population is high. Many pupae were killed during a 24-h period when both guppies and pupae were in contact in a container, although any external injury was not found on pupal skin.--Copyright 1974, Biological Abstracts, Inc.

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED CLINTON POWER STATION UNITS 1 AND 2, ILLINOIS POWER COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Report No. Dockets 50461-93 and 50462-91, October 1974. 309 p, 48 fig, 44 tab, 178 ref, 7 append.

Descriptors: *Salt Creek, *Nuclear powerplants, *Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, Lake, *Illinois.
Identifiers: *Environmental impact statements, *Boiling water reactors.

The proposed Clinton Power Station, Units 1 and 2 will be located in DeWitt County, Illinois, and will employ two identical boiling water reactors cooled by a once-through flow of water from a lake and Salt Creek. It is concluded to issue construction permits for the facilities subject to the following conditions: (1) avoid unnecessary environmental impacts during construction; (2) limit discharge water to 96 F, (3) define land use plan for recreation and conservation at the site; (4) do preoperational monitoring as specified; (5) provide a periodic review of construction activities for conformity as specified; (6) provide written notification of construction activities which may result in adverse impacts; and (7) provide a plan of action to eliminate harmful effects or damage. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO CONSTRUCTION OF RIVER BEND NUCLEAR POWER STATION, UNITS 1 AND 2, GULF STATES UTILITIES COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Report No. Dockets 50458-70 and 50459-67, Sept. 1974. 204 p, 30 fig, 53 tab, 99 ref, 5 append, 1 biblio.

Descriptors: *Mississippi River, *Nuclear powerplants, *Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Louisiana.
Identifiers: *Environmental impact statements, *Boiling-water reactors.

The proposed River Bend Station, Units 1 and 2 will be located on the Mississippi River in Louisiana and will employ two identical boiling-water reactors. The exhaust steam will be cooled by mechanical cooling towers using make-up water obtained from and discharged to the Mississippi River. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. It is concluded to issue construction permits for the facility subject to the following conditions: (1) perform certain delineated work to avoid adverse environmental impacts during construction; (2) install gaseous waste treatment equipment to meet stipulated guidelines; (3) perform preoperational monitoring as specified; (4) provide a periodic review of construction activities as set forth in the construction permit; (5) notify director of licensing of any unexpected adverse effects and suggest a plan of action to eliminate such impacts. (Houser-ORNL)

FINAL ENVIRONMENTAL STATEMENT RELATED TO THE PROPOSED PILGRIM NUCLEAR POWER STATION UNIT 2 BOSTON EDISON COMPANY.
Directorate of Licensing (AEC), Washington, D.C.
Report No. Docket 50471-65, Sept. 1974. 314 p, 29 fig, 38 tab, 123 ref, 3 append.

Descriptors: *Nuclear powerplants, Effluents, Environment, Administrative agencies, *Comprehensive planning, *Sites, Geology, Investigations, Hydrology, Seismology, Climatology, Meteorology, Ecology, Radioactive wastes, Water pollution, Water pollution sources, Radioactive effects, Monitoring, Public health, Transportation, Beneficial use, Cost-benefit analysis, *Massachusetts.
Identifiers: *Pressurized water reactors, *Cape Cod Bay(Mass), *Environmental impact statements.

The proposed Pilgrim Nuclear Power Station, Unit 2 is located in Massachusetts near the town of Plymouth and will employ a pressurized water reactor cooled by water from and discharged to Cape Cod Bay. The conclusion is to issue a construction permit subject to the following conditions: (1) avoid unnecessary impacts during construction; (2) perform preoperational monitoring as specified; (3) perform periodic reviews of construction activities for conformity to conditions in the permit; (4) provide written notification of unexpected adverse impacts and provide a plan of action to eliminate/reduce the harmful effects or damage. Environmental impacts are assessed and after consideration of alternatives an environmental benefit-cost summary was compiled. Environmental factors considered include climate, hydrology (surface water and ground water), ecology including aquatic life, cooling-water supply and discharge, cooling towers, cooling lakes, spray ponds, radioactive chemical and sanitary wastes, amount of dissolved oxygen and toxic chemicals in effluent water. EFFECTIVENESS OF TWO NITRIFICATION INHIBITORS FOR ANHYDROUS AMMONIA UNDER IRRIGATED AND DRYLAND CONDITIONS,
Agricultural Research Service, Pullman, Wash.
V. L. Cochran, R. I. Papendick, and W. M. Woody.
Agron J. Vol 65, No 4, p 649-653. 1973, Illus.
Identifiers: *Ammonia(Anhydrous), Azide, Chloro-6-Trichloromethyl, *Dryland conditions, Inhibitors, *Irrigated land, Leaching, *Nitrification, Nitrogen, Potassium, Pyridine, Retention, Triticum-Aestivum, Zones, *Washington, Absorption.

Potassium azide (KN3) and 2-chloro-6-(trichloromethyl) pyridine (N-Serve) were evaluated as nitrification inhibitors for anhydrous NH3 field applied on irrigated and nonirrigated Ritzville silt loam and on nonirrigated Naff silt loam in eastern Washington. Formulations of KN3, N-Serve in liquid NH3, or Nh3 alone were applied to follow soil in midsummer at a rate of 90 kg N/ha. Irrigations were 15 cm of water sprinkler applied 1 day or 2 wk after fertilizer application, and 10-15 cm of water each time at 4,8 and 13 wk after NH3 application. The NH3 retention zone was sampled for NH+4 and NO-3 periodically through Dec. for the Naff soil and through Feb. for the Ritzville soil. Both KN3 and N-Serve effectively inhibited nitrification of the applied NH3 on nonirrigated Ritzville soil when temperature and soil moisture were favorable for rapid nitrification. However, KN3 was completely ineffective following irrigation or, for the Naff soil, after rainwater penetrated below the retention zone 2 wk after N application. Where irrigated 1 day or 2 wk after fertillization application, all of the applied N had disappeared from the initial NH3 retention zone in the Ritzville soil in 8-13 wk for both NH3 alone and NH3 + KN3. Results with the Naff soil for these applications were similar to results with the irrigated Ritzville soil. By contrast, N-Serve effectively suppressed nitrification under leaching and nonleaching conditions. For the Ritzville soil, total N uptake by the wheat (Triticum aestivum L.) crop for different rates of fertilizer application followed the order of NH3 + KN3 greater than NH3 + N-Serve greater than NH3 alone, but grain yields with NH3 + inhibitor were not different from yields with NH3 alone. For the Naff soil there was no N-uptake or grain-yield response to N rates, and thus no response to the inhibitors.--Copyright 1974, Biological Abstracts, Inc.

COMPLYING WITH DISCHARGE REGULATIONS,
Environmental Protection Agency, Washington, D. C.
C. J. Schafer, and N. Lailas.
Environmental Science and Technology, Vol 8, No 10, p 903-906, October 1974. 1 fig, 2 tab.

Descriptors: *Discharge(water), *Federal Water Pollution Control Act, *Effluents, *Legislation, Planning, Analysis, Monitoring, *Water permits, *Water pollution control.

Under the new national permit system for pollutant discharge, the National Pollutant Discharge

Elimination System, all industries and municipalities must limit their point source effluent discharges into navigable waters. The permit to be issued has a compliance schedule and monitoring requirements. Target dates are July, 1977 for 'best practicable control technology currently available', and July, 1983 for 'best available treatment economically achievable', as part of the Federal Water Pollution Control Act Amendments (PL 92-500). The legislation gives Environmental Protection Agency administrators the responsibility of publishing regulations with guidelines for effluent limitations. Compliance schedules contain dates for the preparation of engineering reports, planning and completion of construction, and the operation of wastewater treatment facilities. Permits will be issued for fixed terms, the maximum duration being five years. The permits must specify self-monitoring requirements for a facility including sample type, frequency of analysis, and frequency of reporting to the regulatory agency. Discharges will be reported by each municipality of industrial facility on a 'Monitoring Discharge Form', recording minimum, average, and maximum values in terms of quantity and concentration, representing a 24-hour day, as obtained from the analysis performed. It will be the responsibility of the permittee to notify the EPA regional administrator if he cannot comply with effluent limitations at any time. (Prague-FIRL)

U.S. Patent No 3,843,517, 5 p, 6 tab, 9 ref; Official Gazette of the United Stated Patent Office, Vol 927, No 4, p 1636, October 22, 1974.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution control, *Water quality control, Pollution abatement, Freeze drying, Microorganisms, Nutrients.

Substances and methods are described for removing oils and other hydrocarbons from surfaces such as shorelines and those of fresh and salt water, whether contained or essentially open. The substances comprise freeze-drying, (1) microorganisms along with nutrients, or (2) microorganisms within a carrier material, or (3) microorganisms within a carrier also containing nutrients. Alternatively, freeze-dried microorganisms may be admixed with a carrier material which may or may not contain nutrients. For removal of a hydrocarbon or oil, any of these compositions, or a mixture, is placed on the hydrocarbon or oil deposit to be removed. The oil or hydrocarbon is then digested by the microorganisms. The carrier adsorbs and concentrates the oil in the presence of the microorganisms and the microorganisms consume the oil. The microorganisms remain viable in these compositions even after long storage periods. In an alternative composition, the microorganisms may be freeze-dried and then admixed with a carrier such as clays, vermiculites, perlites, silica gels or so on. (Sinha-OEIS)

DESIGN AND APPLICATION OF A MULTIPURPOSE MANAGEMENT INFORMATION SYSTEM FOR DRINKING WATER QUALITY ASSESSMENT IN DISTRIBUTION SYSTEMS,
Drexel Univ., Philadelphia, Pa.
S. Kovacs.
Available from Xerox University Microfilms, Ann Arbor, Mich, 48106, Order No. 74-20,716. Ph.D. Thesis, 1974. 314 p.

Descriptors: *Computer models, *Water quality control, *Domestic water, *Water management(Applied), Public health, Operations, Management, Mathematical models, Water supply, *Design, Potable water, *Water distribution(Applied).
Identifiers: Multipurpose management information system(MMIS).

A computer based multipurpose management information system, MMIS, for drinking water quality data has been designed. The City of Philadelphia, Pennsylvania was used as a prototype model. Degradation of water quality can be a public health hazard and cause aesthetic problems of discoloration, taste, and odor. An MMIS is necessary to provide correct and available information on water quality indicators in distribution systems. The MMIS can be utilized in the research of cause and effect relationships of water quality deterioration and also for managerial and operational decision-making. Statistical techniques which are appropriate for the study of water quality deterioration and for the empirical definition of water quality are presented. The MMIS can be adapted by a municipal water utility to meet its specific information requirements. The MMIS can also be used as a modular subsystem of an overall water utility management information system. (Orr-FIRL)

A BALANCED APPROACH TO RESOURCE EXTRACTION AND CREATIVE LAND DEVELOPMENT ASSOCIATED WITH OPEN-PIT COPPER MINING IN SOUTHERN ARIZONA,
F. S. Matter, K. N. Clark, J. A. Hann, S. P. Schuman, and B. J. Blanchard.
University of Arizona, Tucson College of Architecture and the College of Mines, 1974. 85 p. Drawings (w/overlays), photographs, maps, 6 ref.

Descriptors: *Mine wastes, *Comprehensive planning, *Environmental effects, *Land use, *Model studies, *Landscaping, *Terracing, Mining, Waste disposal, Water pollution sources, Water demand, Multiple-purpose projects, Area development, Cost-benefit analysis, Arizona, Alternative planning, Aesthetics.

The problem areas associated with the 6 open-pit copper mining operations in a 21-mile stretch along the Sierita foothills on the western side of the Santa Cruz Fiver Valley, Pima County, Southern Arizona were disposal of overburden, trailing ponds and water demand, all characteristics of environmental problems generally associated with this method of extraction. In the proposed solutions, an attempt has been made to balance possible new uses for areas now considered environmental liabilities with the operational constraints that created them. Factors taken into account in considering tradeoffs are the presence of agricultural activities, ranching, residential settlements, Papago Indian reservation, state-owned land, proximity to Tucson, dependent on the river basin affected for one-third of its groundwater needs. Ideas presented are conceptual models designed to illustrate possible land use patterns, both short-term implications for two sites, and long-term implications as built into a comprehensive plan for the Santa Cruz Valley. Some of these ideas project new methods for waste and tailings disposal, use of terraces to create mines-residential interfaces through man-made landscapes, increased efficiency in water recycling. The schematic description of satellite city developments includes attention to economic, environmental, and aesthetic considerations. (Paylore-Arizona)

AN ECONOMIC ANALYSIS OF AGRICULTURAL LAND USE PRACTICES TO CONTROL WATER QUALITY,
Cornell Univ., Ithaca, N. Y.
J. J. Jacobs, and J. F. Timmons.
American Journal of Agricultural Economics, Vol 56, No 4, p 791-798, November 1974. 2 tab, 10 ref.

Descriptors: *Water quality control, Agriculture, *Land use, *Phosphorus, *Sediment, *Linear programming, *Cost-benefit analysis, Estimating, Streams, Constraints, Crops, River basins, Methodology, Surface waters, Watersheds(Basins), Abatement, Costs, Mathematical Models, Computers, Systems analysis.
Identifiers: *Economic analysis, Cost minimization, Distribution of costs.

Sediment and phosphorus losses to streams from crop and pasture land can be reduced through production practices. Costs (measured in terms of reductions in farm income) of changes in agricultural practices necessary to achieve various levels of soil and phosphorus in surface water leaving a watershed are analyzed. The data requirement for selecting and analyzing alternative levels of water quality is outlined, the least-cost means of achieving particular quality levels via agricultural production practices is estimated, and the benefits needed to offset costs of achieving a particular level of water quality are determined. A combination of cost minimization and incremental cost-benefit analysis is used. A linear programming model is formulated to estimate the cost of reducing soil and phosphorus entering the stream from agricultural lands. Then an attempt is made to estimate the benefit of reduced soil losses to a municipal water supply and to recreational uses. The framework is applied to the Nishnabotna River Basin in southwestern Iowa. Results show that the associated abatement costs to farmers are substantial and increase rapidly as the sediment and phosphorus constraints become more stringent. Distribution of these costs is determined by the type of regulation established. (Bell-Cornell)

ENVIRONMENTAL VALUES AND WATER QUALITY PLANNING,
California Univ., Davis. Div. of Environmental Studies.
P. Richerson, and R. Johnston.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY2, Proceedings paper No 11136, p 259-276, February 1975. 2 fig, 59 ref.

Descriptors: *Human resources, Hydraulics, *Project feasibility, *Water quality, Natural resources, *Recreation, Value, Mathematical models, *Planning, Esthetics.
Identifiers: *Environmental quality, Economic analysis, Government agencies, Uncertainty principle.

Two fundamental types of problems affect the incorporation of wilderness, scenic, and recreation values into water quality planning: (1) problems of incommensurable values; and (2) problems of incomplete information. The nature of these problems is reviewed in the context of rational planning models. Criticized is the rational goal-oriented benefit maximizing model of planning that ignores the problems of value and knowledge. State-of-the-art methods for coping with value and information difficulties, including NEPA, the Water Resources Council Principles and Standards, and contingency planning techniques, are described. An empirical research strategy for investigating planning behavior is proposed and preliminary results for three agencies, the United States Army Corps of Engineers, the Federal Bureau of Land Management, and the California State Water Resources Control Board, are reported. In order to incorporate environmental and recreation interests successfully into decision making, water quality planners must be prepared to actively experiment with the quasipolitical techniques that public participation implies. They must candidly evaluate the quality and comprehensiveness of their information and knowledge and be prepared to make more extensive use of flexible short-range and contingency-oriented approaches than of long-range comprehensive planning and its ideals. AN IN-DEPTH LOOK AT FEDERAL POLLUTION CONTROLS,
Wisconsin Univ., Madison.
R. E. Graves.
Hoard's Dairyman, Vol 119, No 9, p 614, 653, May 10, 1974. 1 fig.

Descriptors: *Regulation, *Environmental control, *Feed lots, Livestock, Poultry, Agricultural runoff, Permits, Waste treatment, Waste disposal, Federal Water Pollution Control Act, *Water pollution control, *Farm wastes.
Identifiers: Federal pollution controls, *Zero discharge.

New EPA guidelines for feedlots were published in February and were met with tremendous reaction. One reason for the strong reaction was that they seemed to include livestock under every conceivable system of management. No distinction was made based on numbers of animals, concentration of animals, or location with respect to streams or lakes. EPA considers any confined group of beef, dairy cattle, swine, sheep, horses, chickens, turkeys, or ducks a potential feedlot. The most drastic change found in the guidelines and standards recently issued was the exclusion of smaller livestock farms. Exclusion from these regulations does not mean that smaller livestock farms can forget about pollution control. Any person or firm is still responsible for water pollution resulting from its actions or inactions. The most outstanding conclusion and recommendation of this report deals with 'zero discharge'. Without establishing a meaningful definition of zero discharge or even feedlot pollution, it was concluded that practicable available technology is available to achieve zero discharge from all feedlots by July 1, 1977. Descriptors: *Pollution abatement, *Water quality control, *Waste water treatment, *Management, Operation, Planning, Model studies, Theoretical analysis.

The increases in water pollution problems and in the public demands for high quality water necessitate the proper management of regional water quality systems. To assist in the management of the stochastic nature of a regional water quality system the following were developed: a model of the reliability associated with the system goals; programs describing the system management strategies; and a sensitivity analysis to provide planners with alternative solutions subjected to changes in water quality requirements. Operating characteristics curves were formulated for mjaor waste water treatment plants. These curves illustrated the relationships between the quality of treated waste effluent quality and regional water system reliability and also the impact of each waste water treatment plant on regional water quality. The overall process efficiency distributions for major waste water treatment plants were discussed and described by some standard distributions. (Orr-FIRL)

MANUAL FOR DEICING CHEMICALS: APPLICATION PRACTICES,
Little (Arthur D.), Inc., Cambridge, Mass.
D. L. Richardson, R. C. Terry, J. B. Metzger, and R. J. Carroll.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Environmental Protection Agency, Cincinnati, Ohio. Report EPA-670/2-74-045, p 152, December 1974. 55 fig, 8 tab, 10 ref, 1 append. 1BB034; ROAP-ATB; TASK-036, EPA Contract No 68-03-0154.

Descriptors: Sodium chloride, Calcium chlorides, Sands, Snow, Ice, Supervision, *Deicers, *Snow removal *Maintenance, Salts.
Identifiers: Deicing chemical spreaders, *Deicing chemicals, Deicing chemical usage, Snow and ice control management, Citizen participation, Winter road maintenance.

Results are presented of a study to minimize the loss to the environment of chemicals used in controlling snow and ice on highways. Based on the best current practices for highway maintenance as observed during two years of study, practical guidelines are presented for the use of deicing chemicals. (1) Supervisory aspects of proper chemical usage are defined, including organization and personnel training. (2) Efficient snow and ice control requires good judgment and appropriate action. Elements of proper decision-making are discussed, including weather forecasting, setting chemical application rates, and accounting for chemical usage. (3) The backbone of winter road maintenance is equipment. General requirements and major equipment classes are described, including recent improvements and advantages or disadvantages. Methods are given for accurate spreader calibrations. (4) Means are described for developing and enlisting the support of citizens and drivers for winter road maintenance policies. (5) Legal requirements for and constraints on snow and ice control are described. (See also W75-04568) (EPA)

MANUAL FOR DEICING CHEMICALS: STORAGE AND HANDLING,
Little (Arthur D.), Inc., Cambridge, Mass.
D. L. Richardson, C. P. Campbell, R. J. Carroll, D. I. Hellstrom, and J. B. Metzger.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-236 152, $4.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Cincinnati, Ohio. Report EPA-670/2-74-033, p 88, July 1974. 33 fig, 8 tab, 6 ref. 1BB034/ROAP 21ASZ/TASK AE, EPA Contract No 68-03-0154.

Descriptors: *Calcium chloride, *Deicers, *Ice, *Snow removal, *Sands, Highways, *Salts.
Identifiers: Deicing chemical storage, Deicing chemical handling, Highway deicing chemicals, Bulk storage, Bulk handling.

Results are presented of a study to minimize the loss to the environment of chemicals used in controlling snow and ice on highways. Based on the best current practices for highway maintenance as observed during two years of study, practical guidelines are presented for good practice in the storage and handling of deicing chemicals. (1) Covered storage of salt and other deicing chemicals is strongly recommended; permanent structures for this purpose are preferable. Guidelines are given for site selection and for design foundations, paved working area, and site drainage. Existing storage facilities are presented that represent a range of costs, designs, construction materials and storage capacities. (2) For the handling of salt and other deicing chemicals, general precautions and good housekeeping practices are defined. (3) Environmental responsibilities are discussed for personnel who administer and supervise highway maintenance. (See also W75-04567) (EPA)
W75-04568

ENFORCEMENT ECONOMICS IN AIR POLLUTION CONTROL,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Economics.
P. B. Downing, and W. D. Watson, Jr.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, price $1.50. Environmental Protection Agency, Report EPA-600/5-73-014, p 104, December 1974. 17 fig, 17 tab, 15 ref, append. 1HA094.

Descriptors: Economics, *Air pollution, *Cost analysis, *Alternative costs, Monte Carlo method, Simulation analysis.
Identifiers: *Air pollution control.

The effects of alternative enforcement strategies on the pollution control activities of the generalized model of a firm are investigated. There are a number of tradeoffs available to a firm including delay and non-compliance which allow it to minimize expected pollution control costs. These are identified within the context of a generalized behavioral model for the firm and an empirical study is undertaken to determine their importance. In a simulation of current enforcement of the federal new source particulate matter discharge standard for coal-fired power plants it is found that cost-minimizing power plants will install relatively costly pollution control technology and frequently violate federal fly ash standards. Two alternative enforcement strategies for overcoming these shortcomings, namely compliance tests in combination with emission taxes and emission taxes alone, are analyzed. In the case of the federal fly ash discharge standard for coal-fired power plants it is tentatively concluded that emission tax enforcement would probably result in an approximate minimization of the sum of firm and enforcement agency resource costs. The general applicability of this result to other enforcement problems is discussed. (EPA)
W75-04569

AN EVALUATION OF MARKETABLE EFFLUENT PERMIT SYSTEMS,
Meta Systems, Inc., Cambridge, Mass.
R. J. deLucia.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, Price $4.15. Environmental Protection Agency report number, EPA-600/5-74-030, September 1974. 333 p, 4 fig, 14 tab, 2 append. IBA 030, ROAP 21AXN06. EPA Contract 68-01-1882.

Descriptors: *Permits, *Model studies, *Water pollution control, Water permits, Regulation, *Simulation analysis, Administration, Legal aspects, River basins, *Pollution charges(Taxes), *New York, Costs.
Identifiers: *Marketable effluent permits, *Mohawk River(NY).

The practical problems and prospects of using marketable effluent permits (MEP) as a water pollution control tool are studied. Under such a system, pollution rights are contingent upon possession of permits; the permits are acquired and/or traded through an auction or market. This study details the requirements of MEP systems, discusses their theoretical advantages, and examines them through the use of industrial organization theory, comparisons with analogous markets, and a simulation model. The simulation model employs Mohawk River data to determine the effect of different system parameters on the operation of a MEP system. The legal and administrative aspects of the marketable permit system are also dealt with. The conclusion is that marketable permits are a promising control tool for many river basins. (EPA)

USED OIL LAW IN THE UNITED STATES AND EUROPE,
Environmental Law Inst., Washington, D. C.
W. A. Irwin, and R. A. Liroff.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, Price $3.65. Environmental Protection Agency, Report EPA-600/5-74-025, July 1974. 289 p, 6 tab, 9 append. 1D1315-24ACN-04 1B1030-51AQK-03, 68-01-2203.

Descriptors: Environment, Air environment, Aquatic environment, Air pollution, Oil, Oil pollution, *Oil wastes, *Waste disposal, *Regulation, *Legal aspects, Jurisdiction, Vegetation, Water law, *Water pollution control, United States, Europe.

Existing information is reviewed on the collection and disposal of used automotive and industrial oils and on the potential health risks of improper disposal of such oils. Provisions of federal law governing disposal of used oils are analyzed. The history of federal taxation of lubricating oils is recounted, as is that of federal requirements for labeling products made from used oils. State laws regulating used oil disposal and reprocessed oil labeling are analyzed and the laws (and/or proposed laws) of several other industrialized nations governing used oil collection and disposal are described. The elements of a comprehensive program for regulating used oil collection and disposal and alternative means for implementing and funding such a program are discussed. Recent Congressional bills relating to used oils are examined. (EPA)

ECONOMIC DISINCENTIVES FOR POLLUTION CONTROL: LEGAL, POLITICAL, AND ADMINISTRATIVE DISINCENTIVES,
Environmental Law Inst., Washington, D. C.
W. A. Irwin, and R. A. Liroff.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, Price $3.35. Environmental Protection Agency, Report EPA-600/5-74-026, July 1974. 257 p, 16 append. 1D1315-24ACN-04, 1B1030-51AQK-03, 68-01-2203.

Descriptors: Environment, Air environment, Aquatic environment, Air pollution, *Legal aspects, Jurisdiction, Regulation, *Pollution charges(Taxes), *Economics, Taxes, Water pollution control, *Constitutional law, Legislation.
Identifiers: *Disincentives(Economic).

An economic disincentive is defined as a monetary charge levied by government on conduct which is not illegal but which does impose social costs, for the principal purpose of discouraging the conduct. Disincentives are distinguished from other legal mechanisms which may have incidental economic disincentive effects, e.g., fines, user charges, and license fees. The constitutionality of federal or state imposition of disincentives is examined and the authority of the U.S. Environmental Protection Agency and the States to utilize disincentives under selected federal environmental statutes is analyzed. The legality of some disincentives adopted by states is discussed. The charges imposed by several European countries are described and distinguished from disincentives. The history of some previous proposals for federal disincentives is reviewed and suggestions for additional disincentives which might be feasible are offered. (EPA)

ENVIRONMENTAL LAND AND WATER MANAGEMENT ACT--AMENDMENTS,
Florida Sess. Laws, Vol 4, Ch. 74-326, p 782-784, approved June 26, 1974, effective July 1, 1974 (1974). 3 p.

Descriptors: *Land resources, *Water resources development, *Land management, *Water management (Applied), Land development, Land use, Natural resources, Water resources, Enforcement, Legislation, adoption of practices, Regional analysis, Regional development, Economic aspects, Social aspects, Regions, Comprehensive planning, *Florida.
Identifiers: State policy, *Environmental policy.

Amendments to the Florida Environmental Land and Water Management Act provide for the procedure involved in obtaining a permit for a development of regional impact (DRI). Hearings by local governments for applications on DRI's are provided only after the regional planning agency certifies that the application contains sufficient information or written notice is received that the requested information will not be supplied. Notice of such hearings shall be given sixty days in advance. A decision will be made on each application within thirty days, unless an extension is requested by the developer. The act also provides for joint public hearings on DRI's. Where two or more developments of regional impact are being jointly undertaken a joint review of applications is available. Enforcement procedures are also included. (Proctor-Florida)

WATER QUALITY MANAGEMENT BASIN PLANS REGULATIONS ADOPTED,
Pollution Control Guide, Vol 3, paragraph 19738, p 19277, 1974. 1 p.

Descriptors: Basins, *River basin development, *Water quality, Groundwater basins, Watersheds(Basins), Demonstration watersheds, Water law, Regions, *Watershed management, Water resources development, Data collections, Data processing, *Regulation, Law enforcement, Administrative agencies, Administrative decisions, Inter-agency cooperation, Water quality control, Planning, Water management(Applied).
Identifiers: *Administrative regulations, *Environmental policy.

Requirements for preparation of water quality management basin plans and the procedures governing basin plan adoption, submission, revision, and Environmental Protection Agency approval are described. Basin plans must be coordinated with any discharge permits for sources located in the planning area. The basin plans are to be generally designed to accommodate water quality management both in areas having complex water quality problems and in less complicated situations. Written comments on the proposed regulations were received from interested parties and incorporated into the regulations where appropriate. As a result, the requirement that basin plans be coordinated with water quality standards implementation plans has been deleted. Each basin plan must be revised within five years of the last approval date. Specific considerations in the revision process are listed. An effective date is provided. (Sperling-Florida)

EPA EFFORTS TO END FEEDLOT MANURE POLLUTION CRITICIZED,
Pollution Control Guide, Vol 3, paragraph 19784, p 19371-19374, 1974. 4 p.

Descriptors: *Feedlots, *Management, *Farm wastes, *Farm management, Economics, Cattle, Livestock, Fertilizers, Waste disposal, Water quality, Water law, Water policy, Water quality control, Water quality standards, Resources development, Pollution abatement, Water pollution control, Alternative planning, Administration, Administrative decisions, Federal government.
Identifiers: *Administrative regulations, Congressional hearings, Environmental policy.

The House Committee on Government Operations criticized the Environmental Protection Agency and the Department of Agriculture for inadequate efforts to control feedlot manure pollution and for failing to encourage use of manure for fertilizer. Today, food animals and some racehorses are raised in small, concentrated areas, called feedlots, some of which are within metropolitan areas. About 2 billion tons of animal wastes are produced annually in the United States. When used properly in agriculture, animal wastes are a valuable resource. When such wastes, however, are discharged into a navigable waterway, they often cause severe oxygen depletion for miles downstream which results in fish kills. The Refuse Act of 1899 has been used to require all feedlot owners and operators to obtain permits before discharging the manure into navigable waterways. This attempts to control the pollution at its source. The increasing shortage of chemical fertilizers is causing a renewed interest by farmers in animal wastes as a fertilizer. The Bureau of Mines has also initiated research into the conversion of organic wastes, including animal manure, into fuels. (Sperling-Florida)
W75-04585

EPA TO ISSUE IMPACT STATEMENTS ON SOME REGULATORY ACTIONS,
Pollution Control Guide, Vol 3, paragraph 19760, p 19307-19308, 1974. 2 p.

Descriptors: *Environmental Effects, *Water resources development, *Administrative decisions, Water quality, Legislation, Jurisdiction, Government, Regulation, Permits, Administration, Federal government, Water quality control, Pollution abatement, Water pollution control, Air pollution.
Identifiers: *Environmental impact statement, *National Environmental Policy Act, *Administrative regulations, Environmental policy.

The National Environmental Policy Act of 1969 requires that federal agencies prepare detailed environmental statements on proposals for legislation and other federal actions significantly affecting the quality of the human environment. The objectives of NEPA are to compel an agency's decision-making process to include an appropriate and careful consideration of all environmental aspects of proposed actions. The Federal Courts of Appeals have held that federal agencies need not prepare environmental impact statements for environmentally protective activities. In recognition of statutory and court-ordered deadlines, and the need for prompt pollution abatement, impact statements must be prepared in connection with all ocean dumping site designations. The Environmental Protection Agency, while not required to file an impact statement for its actions, is presently informing the public of the environmental effects of its major regulatory actions. (Sperling-Florida)
W75-04586

PERMIT PROVISIONS ADOPTED FOR OCEAN WATER ACTIVITY,
Pollution Control Guide, Vol 3, paragraph 19810, p 19432-19436, 1974. 5 p.

Descriptors: *Oceans, *Navigable waters, *Regulation, *Dredging, Construction, Water pollution, Water pollution sources, Bodies of water, Water resources development, Water quality, Federal Water Pollution Control Act, Rivers and Harbors Act, Legislation, Judicial decisions, Jurisdiction, Permits, Waste disposal, Disposal, Administrative agencies, Federal government.
Identifiers: *Administrative regulations, Environmental policy, Fill permits, National Environmental Policy Act, FWPCA Amendments of 1972.

Proposed regulations prescribe the policy, practice and procedure to be followed by all Army Corps of Engineers installations and activities in connection with applications for permits authorizing structures and work affecting navigable waters. The regulations are set forth pursuant to the Rivers and Harbors Act of 1899, the Federal Water Pollution Control Act and the Marine Protection, Research and Sanctuaries Act. Provisions related to the discharge of dredged or fill material into navigable waters and the transportation of dredged material for the purpose of dumping it into ocean waters. The Department of the Army publishes the final regulations which prescribe the policies, practice and procedures to be followed in processing Army permits. The regulations have been revised and compiled based on comments received from the general public, other federal agencies, and Corps field offices as well as interpretive guidance received from recent judicial decisions. The analysis of the provisions summarizes comments of particular significance and discusses the basis for the decisions which were made. (Sperling-Florida)

PROPOSED 1973 OUTER CONTINENTAL SHELF OIL AND GAS GENERAL LEASE SALE OFFSHORE MISSISSIPPI, ALABAMA, AND FLORIDA, VOLUME 4, (FINAL ENVIRONMENTAL STATEMENT),
Bureau of Land Management, Washington, D. C.
Available from National Technical Information Service, U.S. Dept. of Commerce, Springfield, Va. 22161, as EIS-MS-73-1651-F-4, $10.60 paper copy, $2.25 microfiche. October 17, 1973. 335 p, 2 map, 6 graph, 6 tab.

Descriptors: *Environmental effects, *Leases, *Oil wells, *Continental shelf, *Gulf of Mexico, Offshore platforms, Gulf coastal plain, Mississippi, Alabama, Florida, Federal government, Federal jurisdiction, Mineral industry, Administrative agencies, Oil pollution, Oil industry, Exploitation, Exploration, Oil, Administration, Contracts, Water law, Legal aspects, Oil spills, Oil fields.
Identifiers: *Environmental impact statements, Offshore mineral leases, Territorial seas(Jurisdiction), Liability(Legal aspects), Energy crisis.

This volume is one of five volumes which comprise the Final Environmental Statement for the Outer Continental Shelf (OCS). This section presents an account of the consultation and coordination processes involved in the preparation of the draft and final statements. All federal and state agency review comments are included, and where appropriate, the disposition of pertinent comments leading to preparation of the final statement are indicated. Also included are public hearing testimony and records, and written comments from private organizations. The major areas of concern expressed by the public were: the veracity of the 'energy crisis'; compatibility of offshore mineral operations with defense activities; the degree of state participation in OCS operations; liability in the event of pollution incidents; the adequacy of operating regulations and enforcement procedures; the need for consideration of alternatives to the proposed action unique to Florida; the need for preparation of cost benefit analyses; and the need for a public referendum concerning whether or not to proceed with the proposal. (See also W75-04590) (Deckert-Florida)
W75-04589

PROPOSED 1973 OUTER CONTINENTAL SHELF OIL AND GAS GENERAL LEASE SALE, OFFSHORE MISSISSIPPI, ALABAMA, AND FLORIDA, VOLUME 5, (FINAL ENVIRONMENTAL STATEMENT),
Bureau of Land Management, Washington, D. C.
Available from National Technical Information Service, U.S. Dept. of Commerce, Springfield, Va. 22161, as EIS-MS-73-1651-F-5, $8.50 paper copy, $2.25 microfiche. October 17, 1973. 262 p, 22 tab, 4 diagram, 12 graph, 6 map.

Descriptors: *Environmental effects, *Continental shelf, *Gulf of Mexico, *Oil, *Leases, Coasts, Federal government, Legal aspects, Exploitation, Exploration, Oceans, Oil industry, Offshore platforms, Oil wells, Resources development, Resources, Administration, Adoption of practices.
Identifiers: *Environmental impact statements, Offshore oil leases, Public trust doctrine, Administrative regulations.

Volume five of five volumes comprising the Final Environmental Statement for this proposal contains the following attachments to the statement: (A) outer continental shelf operating orders number 1 through 12, Gulf of Mexico; (B) proposed schedule--provisional outer continental shelf leasing; (C) description of blocks by water depth, distance from shore, acreage; (D) report of the work group on outer continental shelf safety and pollution control, U.S. geological survey; (E) geological time chart and cross sections through the sale area; (F) windroses portraying monthly wind patterns over the Gulf of Mexico; (G) common names and scientific names for marine benthic animals; (H) population, employment, personal income, and earnings by industry, historical and projected; (I) (Department of Defense) fact sheet summarizing potential impact of possible leasing; (J) matrix appendix; (K) geological survey, outer continental shelf oil and gas operations lease and management program; (L) equipment available for emergency oil spill control and cleanup in the Gulf of Mexico; (M) sample outer continental shelf lease form; (N) list of persons who submitted oral and/or written testimony for public hearing record; Plat--depiction of blocks proposed for leasing. (See also W75-04589) (Deckert-Florida)
W75-04590

MONTGOMERY ENVIRONMENTAL COALITION, ET AL. V. FRI, ET AL. (SEEKING DECLARATORY RELIEF FROM FURTHER SEWER HOOKUPS ON POTOMAC).
1 Pollution Control Guide (Vol. 3), paragraph 15017, p 15167-15171, 1973, 5 p.

Descriptors: *Judicial decisions, *District of Columbia, *Federal jurisdiction, *Federal Water Pollution Control Act, *Law enforcement, Water Quality Act, Jurisdiction, Discharge(Water), Water pollution, Water pollution control, Water quality control, Non-structural alternatives, Local governments, State governments, Federal government, Legal aspects, Legal review, Water law, Administration, Governmental interrelations, Legislation, Permits, Adjudication procedure, Adoption of practices, Water quality standards, Water pollution effects.
Identifiers: *FWPCA Amendments of 1972, Standing(Legal), Effluent limitations, Declaratory judgements, Injunctive relief.

Two community groups and the District of Columbia brought suit against eight named government officials and agencies pursuant to the 'Citizen Suits' provision of the Federal Water Pollution Control Act Amendments of 1972. The plaintiffs sought declaratory and injunctive relief ordering the defendants to refrain from approving, authorizing, or permitting further sewer hookup permits which would result in sewage discharges affecting the water quality of the Potomac River. Seven of the eight defendants filed motions to dismiss against the two community groups. The defendants argued that the plaintiff community groups lacked standing to sue and jurisdiction, and that the plaintiff community groups failed to state a claim upon which relief may be granted. The United States District Court ruled that the plaintiff community groups had standing under the provisions of the 1972 Act, and that alleged violations of effluent standards established under the 1965 Water Quality Act satisfied the jurisdictional requirements of the 'Citizen Suits' provision of the 1972 Act. The court granted the motions of three of the defendants, ruling that the allegations in the complaint evidenced acts or powers too indirectly related to control of the pollution to state a cause of action. The court denied the other four motions and ordered the action to proceed against the remaining defendants. (Deckert-Florida)
W75-04591

EPA POLICY ON INJECTION WELLS.
Pollution Control Guide, Vol. 1, paragraph 2416, p 2246-2249, 1973, 4 p.

Descriptors: *Injection wells, *Waste disposal wells, *Environmental effects, *Well permits, *Regulation, Legal aspects, Drilling, Subsurface waters, Water pollution, Water pollution sources, Water law, Environmental control, Water quality control, Federal government, Local governments, Deep-well pumping, Well data, Waste disposal.
Identifiers: *Environmental policy, Administrative regulations.

The Environmental Protection Agency (EPA) policy on subsurface emplacement of fluids by well injection is to protect the subsurface from pollution, ensure that engineering and geological safeguards are adhered to, and encourage alternative means of disposal. The emplacement of fluids by subsurface injection often is considered by government and private agencies as an attractive mechanism for final disposal. Improper injection of municipal or industrial wastes or injection of other fluids for storage or disposal to the subsurface environment could result in serious pollution of water supplies. The effects of these injections could result in environmental damage requiring complex and costly solutions on a long-term basis. The EPA will oppose emplacement of materials by subsurface injection without strict controls and a clear demonstration that such emplacement will not interfere with present or potential use of the subsurface environment. Before using subsurface injection, all reasonable alternative measures must have been explored and found environmentally less satisfactory. Included are parameters to provide regulatory agencies with sufficient information to evaluate the environmental acceptability of any proposed well injection. (Proctor-Florida)
W75-04592

E.P.A. POLICY TO PROTECT THE NATION'S WETLANDS.
Pollution Control Guide, Vol. 1, paragraph 2415, p 2244-2245, 1973, 2 p.

Descriptors: *Water policy, *Wetlands, *Environmental control, *Waste water(Pollution), *Waste water treatment, Water pollution effects, Marshes, Swamps, Aquatic habitats, Aquatic environment, Waste water disposal, Water resources development, Water law, Water pollution, Water management(Applied), Water allocation(Policy), Wildlife conservation, Resource allocation, Conservation, Federal government, Administrative agencies.
Identifiers: Administrative regulations, Environmental policy.

The Environmental Protection Agency (EPA) has espoused a policy to preserve wetland ecosystems and to protect them from destruction through wastewater pollution or nonpoint source discharges. The EPA advocates the development and construction of waste water treatment facilities, because the Nation's wetlands are an irreplaceable water resource that must be preserved. The EPA's policy is to minimize alterations in the quantity or quality of the natural flow of water that nourishes the wetlands. The policy also calls for protection from environmentally unsound dredging and filling, and solid waste management. Through its education and enforcement programs EPA hopes to prevent violation of applicable water quality standards. In compliance with the National Environmental Policy Act of 1969, the EPA will not grant federal funds for the construction of municipal waste water treatment facilities except where no other alternative is feasible. The Department of the Interior will be consulted to determine the impact of treatment programs on fish and wildlife. (Proctor-Florida)

WATER QUALITY STANDARDS: THE FEDERAL PERSPECTIVE--PROGRESS TOWARD OBJECTIVES,
A. Hirsch, J. L. Agee, and R. S. Burd.
Journal Water Pollution Control Federation, Vol 40, No 9, p 1601-1606, Sept 1968, 6 p.

Descriptors: *Water quality control, *Water quality standards, *Water Quality Act, *Water quality, *Federal Water Pollution Control Act, Waste disposal, Water pollution, Water pollution sources, Water pollution treatment, Water treatment, Sewage treatment, Waste water treatment, Legislation, Local governments, State governments, Federal government, Governmental interrelations, Administrative decisions, Environmental control.
Identifiers: Administrative regulations, *FWPCA Amendments of 1972, Environmental policy.

The Water Quality Act of 1965 was enacted to provide for the establishment of water quality standards. The standards contemplated by the Act involve the specification of the uses of a given body of water, determination of criteria to maintain the water quality necessary to support those uses, and development of a compliance plan to achieve and maintain these criteria. The Department of the Interior will approve standards submitted by the states only if the states provide for upgrading waters now polluted and protecting waters already clean. The intent of the Act is to get ahead of the pollution problem. The Federal Water Pollution Control Act's objective has been to jointly establish these standards, which would spearhead an accelerated pollution control effort. The FWPCA makes the establishment of a joint state-federal effort its top priority assignment. A significant aspect of the new water standards is that the implementation plans call for secondary treatment of both municipal and industrial wastes. (Proctor-Florida)

WATER QUALITY CONTROL--THE ROLE OF THE INTERSTATE AGENCY,
Delaware River Basin Commission, Trenton, N.J.
J. F. Wright.
Journal Water Pollution Control Federation, Vol 40, No 8, Part 1, p 1403-1407, August 1968, 5 p.

Descriptors: *Interstate commissions, *Administrative agencies, *Delaware River Basin Commission, *Water quality control, *Watershed management, Water pollution, Political aspects, State governments, Water policy, Water resources development, Water law, Regional development, Planning, Resources allocation, Social aspects, Administrative decisions, Governmental interrelations, Comprehensive planning, Pollution abatement, Water pollution control, Environmental control, Water policy.
Identifiers: Administrative regulations, Environmental policy, Effluent limitations.

The role of the interstate agency in water pollution control is to formulate a comprehensive regional water quality plan. Agencies must work out cooperative programs to implement regional plans. Plan development and application includes the establishment of a division of labor among federal, interstate, state and local authorities. The agency must insure the feedback to the plan of modifications from research and operational experience. All agencies must be prepared to use police powers to insure compliance. One of the most important features in a successful water quality management plan is the sustained interest in competent operation and maintenance of treatment plants. Plants must be well constructed and operated by qualified personnel in order to be effective. The Delaware River Basin Commission is an example of a successful agency's formulation of water quality standards and effective implementation of them. The Commission also illustrates the flexibility and adaptability of an administrative agency to the changing purposes and techniques of a pollution control program. (Proctor-Florida)

AQUATIC PLANT CONTROL PROGRAM, STATE OF FLORIDA (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Jacksonville, Fla.
Available from National Technical Information Service, Springfield, Va 22161, U.S. Dept. Commerce, as EIS-FL-73-1488-F, $7.60 in paper copy, $2.25 in microfiche. September 11, 1973. 201 p, 1 map, 5 photo, 11 graph, 22 tab, 12 diagram.

Descriptors: *Environmental effects, *Water hyacinth, *Florida, *Aquatic weed control, *2,4-D, Aquatic plants, Aquatic environment, Aquatic habitat, Federal government, Clogging, Open channels, Surface waters, Rivers, Streams, Lakes, Herbicides, Water pollution, Flood control, Water quality control, Navigable waters, Chemical properties, Legislation, Aquatic animals, Aquatic weeds.
Identifiers: *Environmental Impact Statements.

Efforts to control the growth and dispersal of water hyacinths in the waters of Florida include the use of the chemical 2,4-D (2,4-dichlorophenoxyacetic acid) in dimethylamine salt formulation and use of biological control agents or other methods in an integrated program when they are feasibile. The explosive growth rate of these exotic plants results in dense clogging of Florida's waterways, restricting navigation and streamflow and adversely affecting the aquatic environment. Removal of these plants will improve navigability and the aquatic habitat. The principal adverse effects will be temporary depletion of dissolved oxygen and increase in the buildup of organic bottom sediment, as well as the possibility of other unforeseen effects due to the incomplete understanding of the long-term effects of repeated 2,4-D applications. Biological and mechanical control methods were considered, but the proposed method is presently the most effective and feasible method available. Although there is little question as to the need to remove the hyacinths, some environmentalists expressed concern over the exten-

sive use of 2,4-D while there remains some uncertainty regarding possible adverse effects. (Deckert-Florida)

ACID MINE WATER, A BIBLIOGRAPHY,
Office of Water Research and Technology, Washington, D.C.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-239 523 $13.00 paper copy, $2.25 microfiche. Water Resources Scientific Information Center, Report WRSIC 75-202, February 1975, 564 p.

Descriptors: *Acid mine water, *Bibliographies, Abstracts, *Coal mine wastes, Industrial wastes, *Mine drainage, *Strip mines, Waste water treatment, Water pollution control.

This report, containing 365 abstracts, is another in a series of planned bibliographies, in water resources to be produced from the information base comprising SELECTED WATER RESOURCES ABSTRACTS (SWRA). At the time of search for this bibliography, the data base had 77,890 abstracts covering SWRA through November 15, 1974 (Volume 7, Number 22). Author and subject indexes are included.

MANURE APPLICATION GUIDELINES FOR THE PACIFIC NORTHWEST,
Oregon State Univ., Corvallis. Dept. of Agricultural Engineering.
T. L. Willrich, D. O. Turner, and V. V. Volk.
Paper No 74-4061 presented at the 1974 Annual Meeting, American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974, 12 p. 5 tab, 2 ref.

Descriptors: *Pacific Northwest U.S., *Farm wastes, *Waste disposal, *Equations, Nitrates, Fertilizers, Nitrogen, Leaching, Livestock, Waste storage, Lagoons, Irrigation, Volatility.
Identifiers: *Application rates, *Land spreading.

Most farmers who apply manure to land know very little about how much to apply. Research must supply the answers before ground water supplies are polluted. Generally nitrogen is the limiting factor in manure application because it readily moves in the soil whereas phosphorus and potassium are more static. Accurate rational equations must be developed to estimate: (1) the amount of nitrogen which should be added to the soil to maximize crop yields and to satisfy the normal losses of nitrogen from the soil and the losses that occur when manure nitrogen is substituted for synthetic nitrogen, and (2) the amount of residual manure nitrogen which remains for soil incorporation after subtracting all losses which occur before soil incorporation. Equations are presented, but future modifications and refinements are essential to correct weaknesses and errors which currently exist. (Russell-East Central)

EPA PREPARING TO 'RAILROAD' THROUGH NEW POLLUTION RULES COVERING CATTLE FEEDLOTS,
Beef, Vol 9, No 12, p 4-5, August, 1973.

Descriptors: *Feed lots, *Cattle, *Farm wastes, Effluents, *Water pollution control, *Regulation, Livestock, Runoff.
Identifiers: *Zero discharge.

The U. S. Environmental Protection Agency, under a court order, is attempting to write regulating guidelines for effluent limitations on all industries. The proposed regulations do not allow any effluent discharge, regardless of weather conditions. Industry leaders are puzzled about the regulations and are hoping to have some influence on them when they appear in the Federal Register. The regulations must be put into effect by October 18, 1973--the court-imposed deadline. (Frantz-East Central)

AN EXAMINATION OF ALTERNATIVE METHODS FOR EMPLOYING BOOMS TO CONTAIN OIL SPILLS IN NAVY HARBORS,
Naval Postgraduate School, Monterey, Calif.
J. J. Larson.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-783 790, $5.25 in paper copy, $2.25 in microfiche. Ms Thesis, p 101, June 1974. 13 fig, 35 ref, 5 append.

Descriptors: *Oil spills, *Water pollution control, Decision making, Evaluation, Oil pollution, Cost-benefit analysis, Harbors, *Alternative planning, *Pollution abatement.
Identifiers: *Floating barriers, *Containment booms, Alternative methods.

One portion of the pollution problem was addressed, that is, methods of employing booms to contain oil spills in harbors controlled by the U.S. Navy. Containment of a spill is an essential step in the process of cleaning up a spill and reducing pollution. A plan was formulated which will enable a decision maker to evaluate and rank three difined methods for deploying oil spill containment boom. The plan is based on a utility analysis of each method, with a decision analysis technique to determine the relative importance of various parameters effecting the utility of each method. Although these parameters are related, they are independent and can be considered individually. The plan identifies the data that must be otained and demonstrates a method for organizing and manipulating the data. This plan can be of assistance to the decision maker in determining an optimum method for boom employment at each naval activity and then determining containment device procurement requirements. PLANNING FOR WATER QUALITY IN THE BEAR RIVER SYSTEM IN THE STATE OF UTAH.
Utah Water Research Lab., Logan.
PRWG-142-1, prepared for State of Utah Department of Social Services, Division of Health, Bureau of Environmental Health. March 1974. 95 p, 12 fig, 7 tab, 19 ref.

Descriptors: *Water quality, *Planning, *Management, *Water pollution control, *River basins, *Data collections, Data processing, Federal Water Pollution Control Act, Baseline studies, Analytical techniques, Hydrologic data, *Utah, Political aspects.
Identifiers: *Bear River(Utah), Effluent limitations, Demographic activities.

A functional planning program is presented to aid in the development of comprehensive water quality management plans for the Bear River system pursuant to the objectives of the Federal Water Pollution Control Act, including 1972 amendments. The objectives will be reached using a two stage process: (1) point sources will be required to meet effluent limitations based on current water pollution control technology, and (2) higher prescribed control levels are to be achieved to meet the 1983 requirements of water quality suitable for fishing and swimming. A program design, an initial analysis of available data, and a priority listing of water pollution necessary for developing a Section 303 (e) basin plan are provided. Physical, chemical, economic, political, and demographic activities which have an impact upon a river basin are described. In the compilation and analysis of the baseline information within the scope of this preliminary study, the following specific objectives were achieved: (1) determination of availability of hydrological and water quality data, (2) assessment of water quality problems in the basin; (3) collection of data according to sources which are local or basin wide, statewide, regional, or federal, (4) presentation of the collected data in a form useful to planners and government officials, (5) preliminary analysis of data problems and gaps and requirements for obtaining additional data, and (6) development of a preliminary basin analysis methodology and data retrieval and updating through use of computer systems. WATER POLLUTION--LIQUID WASTES (AS AMENDED).
Michigan Legislative Service, Vol 2, Public Act No 86, H.B. No 5367, p 177-181, approved April 18, 1974, (1974). 5 p.

Descriptors: *Michigan, *Legislation, *Waste water disposal, *Liquid wastes, Water pollution sources, Treatment facilities, Government finance, Economic aspects, Local governments, Administration, Adoption of practices, Construction, Administrative agencies, Jurisdiction, Planning, Sludge, Sludge disposal, Resources development.
Identifiers: *Administrative regulations, *Effluent charges, State policy, Licenses.

Michigan legislation prevents the discharge of untreated or inadequately treated sewage or other liquid wastes into any waters of the state. The act also provides financial assistance to local agencies for the construction of treatment works to prevent such discharge. A fund is created known as the state water pollution control fund to provide that financial assistance. A grant will not be made for the building and erection of a treatment works until the local agency's governing body has adopted and submitted to the water resources commission a comprehensive long range plan for the control of pollution in the area within its jurisdiction. The commission will promulgate procedures for establishing the priority of eligible projects and for certifying projects for an allocation of grants for treatment works construction. Projects entitled to construction grants will be certified to the administering federal agency from the project list established by the water resources commission and approved by the legislature. AMELIORATION OF EFFECTS OF OIL SPILLS.
Council on Environmental Quality, Washington, D.C.
Federal Register, Vol 37, No 176, p 18411-18412, September 9, 1972.

Descriptors: *Regulation, *Oil spills, *Legislation, *Federal Water Pollution Control Act, *Water pollution sources, Water pollution, Water pollution control, Pollution abatement, Oil, Oily water, Water pollution effects, Administrative agencies, Interagency cooperation, Water resources, Oil industry, Environmental effects, Federal government, Investigations.
Identifiers: *Administrative regulation, Hazardous substances(pollution).

In 1971, the Council on Environmental Quality promulgated the National Oil and Hazardous Substances Contingency Plan, pursuant to the provisions of the Federal Water Pollution Control Act, as amended. Experience with that plan has demonstrated to the National Response Team, which is responsible for planning and coordination of spill response activities, that an amendment should be made. The section of the plan to be amended currently provides for notice to a ship or facility operator of an indication of federal interest and potential action in a spill. The purpose of such a notice is to implement that portion of the FWPCA which authorizes the President to remove a spill unless he determines such removal will be done properly by the operator of the vessel or facility from which the discharge occurs. The NRT advised that this purpose could better be served by clarifying the role of the On-Scene Coordinator in making determinations respecting actions to be taken to ameliorate the effects of a spill and that clarification is the purpose of this amendment. TV INSPECTIONS SLASH SEWER COSTS $300 PER REPAIR,
St. Louis Metropolitan Sewer District, Mo.
S. J. McLaughlin.
The American City, Vol 89, No 9, p 51-52, September, 1974.

Descriptors: *Maintenance, Sewer systems, Pipes, Equipment, Construction, Flow, Planning, Costs.
Identifiers: *Sewer repair, *Television inspection, Preventive maintenance.

A preventive maintenance program at the Metropolitan St. Louis Sewer District was found to reduce costs of sewer repair drastically. In the last year, 2.1 million feet of sewer lines were inspected by closed-circuit television cameras in order to find the causes of failures such as caveins and backups. The previous cost of digging up a trouble area was about $400; each television inspection costs $33, with average repairs costing $40. This saves over $300 per problem. In addition, some critical areas for regular line cleaning operations were identified and computerized. For example, a leaf burning ban is a major cause of expected sewer blockage in the fall when leaves are swept into gutters. Preliminary inspections are also made of each sector of pipe to be cleaned. Wet weather information is obtained from measuring devices placed through manholes. Sewers are cleaned by rodding equipment or bucket machines. By the combination of preventive maintenance, flow surveillance, and equipment improvement, costs of repairs have been cut by about $150,000 per year. (Prague-FIRL)

PHILOSOPHY ON LIVESTOCK WASTE REGULATION,
Missouri Univ., Columbia.
D. R. Levi.
Paper No. 71-918, presented at 1971 Winter Meeting of the American Society of Agricultural Engineers, Chicago, Illinois, December 7-10, 1971. 10 p.

Descriptors: *Farm wastes, *Livestock, *Regulation, *Legal aspects, Feed lots, Agriculture, Biochemical oxygen demand, Effluent, Water pollution control, Odor, Zoning, Waste treatment, Damages.
Identifiers: Nuisances, Site selection.

There are two types of regulations under which a livestock farmer can be prosecuted or fined for environmental damage. The first are public regulations, such as the States and Federal Government have promulgated in the Water Quality Act of 1965 and comparable State bills. These laws usually provide objective criteria for matter discharged into water or air, for example, maximal BOD levels for effluents discharged into streams. Private regulation usually takes the form of nuisance laws, where the more objective human tolerance for noise, odor, or water pollution is given a legal form. A farmer who endangers his neighbors' health, well-being, or livelihood by polluting their water supplies, or making their air foul-smelling is subject to damage suits, injunctions, fines, or a combination of these. Zoning helps to minimize suits since it insures that the land use is not unreasonable in itself. However, a farmer in a zoned agricultural area may still produce a nuisance and be taken to court. Selecting a site for livestock pens as far as possible from homes and complying with all existing State laws and codes cannot only abate the pollution generated by a farm creating a hazard but indeed has done what the law requires. Waste treatment facilities are the single best insurance against legal action, and farmers and agricultural engineers should cooperate to draft realistic and practical laws in agricultural waste control. MANURE PROMOTED FOR CROPLAND.
Calf News, Vol 10, p 18, December, 1972.

Descriptors: *Farm wastes, *Crops, *Fertilizers, Rates of application, Salts, Nitrates, Irrigation, Costs, Nebraska, Nutrients, Feed lots, Soil contamination, Water pollution, Soils, Slopes.
Identifiers: Soil conditioners.

Manure acts as a fertilizer, buffers alkaline soils, and improves such soil characteristics as porosity, granulation, water infiltration rate, and moisture retention. Residual effects may result in a profit even where handling costs exceed one-year value. Salt accumulation should be checked. Maximum application rates recommended are 10-15 tons/acre depending on precipitation and irrigation practices. (East Central State College)
W75-04839

THE RELATIONSHIP BETWEEN ANIMAL WASTES AND WATER QUALITY.
President's Water Pollution Control Advisory Board, Washington, D.C.
Report of Recent Meetings, October, 1971 and January, 1972. 33 p.

Descriptors: *Farm wastes, *Water quality, Recycling, Waste disposal, Lagoons, Basins, Fuels, Oil, Gases, Fertilizers, Feeds, Research and development, Feed lots, Water pollution, Runoff, Colorado, Nebraska, Kansas, Illinois, Indiana, Public health, Monitorings, Strip mines.
Identifiers: Land disposal, Refeeding, Site selection.

The President's Water Pollution Control Advisory Board held meetings in Colorado 26-29 Oct 71 and

in Illinois and Indiana 24-28 Jan 72 to heat testimony on the animal waste pollution problem. Field trips were combined with both meetings. The paper summarizes the hearings. As a consequence of the meetings, the Board presented ten recommendations to EPA. That on uses of animal wastes is: 'The Board believes that recycling animal wastes back onto the land is the best practical approach in most situations, particularly for smaller operators, through the use of catchment basins, lagooning systems, and/or solid waste handling techniques. There are also other possible uses which should be given full consideration. Testimony presented to the Board indicates that promising possibilities exist in converting animal wastes into fuels such as oil or back into animal feeds. It is recommended that the Environmental Protection Agency give high priority to funding for research and development projects which may develop practicable and safe alternate uses for animal wastes.' ECONOMICS, (LITERATURE REVIEW),
Georgia Inst. of Tech., Atlanta, Ga. Envrionmental Resources Center.
L. D. James.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1611-1618, June, 1974. 77 ref.

Descriptors: *Costs, Water resources, *Water resources development, Water pollution, *Reviews, Legislation, *Planning, Management, *Bibliographies.

Two important government documents on water resources planning procedure were published in 1973. New standards for federal water planning in the U.S. were released by the U.S. Water Resources Council. The new approach is that enhancement of environmental quality is included with economic efficiency as planning objectives, and measurement is made of both environmental and economic effects. An increase in planning discount rate to 6.875 percent and a new emphasis that benefits be paid for by the beneficiaries are radical changes from past practice. A five year study by the National Water Commission was completed dealing with water management. 'Zero discharge' was rejected as a goal by the Commission, recommending that the cost of pollution be paid by those who produce it. The evaluation of the causes of conflict between environmental quality and water resources for economic gain was discussed in an assemblage of 28 papers by Goldman for the National Water Commission. Descriptors: River flow, Numerical analysis, *Unsteady flow, *Nevada, *California, Methodology, *Simulation analysis, Model studies, *Flood routing, *Hydrograph analysis.
Identifiers: *Truckee River(Nev-Calif), Implicits method, Sensitivity analysis.

Modelling methodology using finite difference calculus is presented to investigate the simulation capability of the unsteady flow regime in a mountainous stream. A case study of Truckee River is presented where field survey information was utilized in describing the geometric and hydraulic elements of the river at twenty-five reaches. Modelling exercises included were (a) reproducing observed flood hydrographs of 1963 event, (b) bihourly streamflow hydrographs, (c) flood routing of U.S. Army Corps of Engineer's 'Intermediate Regional' and 'Standard Project Flood' events and (d) routing studies of hydraulic surge propogation. Sensitivity analysis indicates that the agreement between observed and computed hydrographs is largely dependent upon the lateral flow regime.

A REGIONAL MODEL OF THE FUTURE DEMAND FOR TRANSPORTATION: THE CASE OF BARGE TRANSPORTATION,
Institute for Water Resources (Army), Alexandria, Va.
B. R. Sasaki.
IWR Paper 74-P3. October 1974. 149 p, 12 fig, 30 tab, 71 ref, append.

Descriptors: *Methodology, *Demand, *Barges, *Transportation, *Economics, *Ohio River, Regions, Coals, Supply, Linear programming, Projections, Technology, *Model studies, Industries, Estimating, Equations, Operations research, Regional analysis.
Identifiers: Commodities, Cost minimization, Discriminant analysis.

Reported is a study which developed a methodology for projecting the future demand for barges in the transport of bituminous coal to selected economic centers. The methodology is based on a general equilibrium model of the supply and demand for specific commodities and then an analysis of the model share consequences of the spatial alignment of supply and demand centers. Demand for transportation is assumed to be derived from the demand for commodities over space. Division of traffic between transport modes is assumed to be a function of the rate and service characteristic of competing modes. Empirical estimates are made of the demand for barge transportation of coal to three functional economic areas of the Ohio River Region--Pittsburgh, Cincinnati, and Evansville. The comprehensive model consists of three interrelated economic models. Demand functions for coal in each area are projected, supply functions for coal production areas competing for these markets are projected, and an equlibrium allocation of trade flows is estimated by linear programming, utilizing minimum average transport cost from each originating region to each destination region. Choice of transport mode is estimated by utilizing discriminant functions based on current (1970) rate and service characterstics for competing modes. (Bell-Cornell)

OLUTION OF SIMULTANEOUS PARTIAL IFFERENTIAL EQUATIONS: AN EXTENSION F PDEL,
alifornia Univ., Los Angeles.
S-h. Choi.
vailable from the National Technical Informa-on Service, Springfield, Va. 22161, as PB-239 2, $5.75 in paper copy, $2.25 in microfiche. Msc, hesis. 1973. 122 p, 7 fig, 2 tab, 37 ref, 2 append. WRT B-150-CAL(6).

escriptors: *Simulation analysis, *Equations, Algorithms, Digital computers, *Computer pro-ams, Numerical analysis, Environmental en-neering, *Air pollution, Pollutants, Costs, Time, athematical models, Systems analysis, Distribution systems.
dentifiers: *Simulation languages, *Simultaneous rtial differential equation.

he capability of PDEL (Partial Differential Equa-on Language) is extended to solve simultaneous rtial differential equations. Specifically, a new ortion of the PDEL translator is designed to han-e simultaneous 1-, 2-, and 3-dimensional elliptic, rabolic and hyperbolic equations and to actually nplement the model for solving simultaneous 2-mensional parabolic equations. The extension is ccomplished by modifying the existing partial dif-rential equation solution algorithm to allow for corporation of an ordinary differential equation olution module rather than by implementing en-rely new and lengthy algorithms to PDEL. A sur-ey of several existing methods for solving simul-neous partial differential equations and a survey ordinary differential equation algorithms are resented. The Fourth-order Range-Kutta method chosen to be implemented in this extension of DEL. The newly implemented ordinary dif-rential equation solution module is tested and ound to be reasonably accurate. When incor-orated into the partial differential equation solu-on scheme for solving simultaneous partial dif-rential equations, the overall performance is tisfactory. For solving several partial dif-rential equations simultaneously, there is only a ight increase in computer time and cost over ose required for solving one such equation. The DEL translator is modified so that only a few ew statements need to be added to a PDEL pro-am in order to handle simultaneous partial dif-rential equations. (Bell-Cornell)
75-04539

ARAMETER IDENTIFICATION IN DIS-RIBUTED SYSTEMS USING A DIGITAL SIMULATION LANGUAGE: AN EXTENSION OF PDEL,
California Univ., Los Angeles.
C. M. Lam.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 431, $4.75 in paper copy, $2.25 in microfiche. MSc Thesis. 1972. 84 p, 4 fig, 19 tab, 15 ref. OWRT B-150-CAL(5).

Descriptors: *Simulation analysis, *Computer programs, Digital computers, Algorithms, Model studies, Data collections, Equations, *Aquifers, *Optimization, Withdrawal, Heat, Diffusion, Systems analysis, Thermal pollution.
Identifiers: Parameter identification, Simulation languages, *Fletcher-Powell method, Partial differential equation, Inverse problems, Convergence, *Heat diffusion.

The capability of PDEL (Partial Differential Equation Language) is extended to handle the parameter identification problem. The following goals are accomplished: (1) a comparison of the existing parameter identification algorithms and the choosing of the most suitable one to be implemented into the existing PDEL system; and (2) the design and construction of a new portion of the parameter identification problems for those equations that can be solved by the existing PDEL system. The comparison study shows that the Fletcher-Powell method is the most suitable algorithm to be used because: its coverge rate is reasonably fast; a large set of problems can be handled; and only minor changes to the existing PDEL system are required. The translator is designed in such a way that, besides specifying the necessary details required for solving the partial differential equation in PDEL, the user has only to add several statements to achieve the parameter identification goal. In practically all presently available languages, including PDEL, parameter identification problems have to be treated by the user on a trial and error basis. The main goal of the extension of PDEL is to ease and speed up parameter identification for a user of PDEL by avoiding such a trial and error process. Two example problems, optimal control of an aquifer, and heat diffusion, are given. (Bell-Cornell)

AN OPERATIONAL FRAMEWORK FOR COASTAL ZONE MANAGEMENT PLANNING.
Meta Systems, Inc., Cambridge, Mass.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 519, $8.75 in paper copy, $2.25 in microfiche. Completion Report, p 274, January 1975. 13 fig, 8 tab, 5 append. OWRT C-5208(No 4211)(1).

Descriptors: Management, Planning, Coasts, *Connecticut, *Model studies, Organizations, Political aspects, Institutional constraints, Programs, Urbanization, Legislation, Environment, *Optimization, *Governmental interrelations, *Algorithms, *Water demands, *Decision making.
Identifiers: Long Island Sound(Conn), *Coastal zone management, *Multi-level programming.

Since the decisionmaking and planning powers in coastal regions are different over a wide range of governmental bodies, a conceptual framework for coastal zone management is needed in order to simplify the process. Such a framework has been developed which attempts to distinguish clearly where in the coastal zone management process the different decisions need be made. Three sets of formal models have been constructed to aid planning. The first set of models checks for consistency between the overall demands placed upon the coastal zone and the environmental carrying capacity of the zone. The second set of models deals with identifying the appropriate goals to be used at the various levels in the planning hierarchy. The third set of models develops a multi-level planning algorithm to provide for efficient transfer of information between the levels of government involved in the coastal zone management process. The models have been tested on the coastal zone of the state of Connecticut.

6B. Evaluation Process

WATER: CANADIAN NEEDS AND RESOURCES,
J. S. Cram.
Harvest House, Ltd., Montreal, Quebec. 3rd ed. July 1973. 206 p.

Descriptors: *Water resources development, *Water management(Applied), *Water allocation(Policy), Distribution systems, Water control, *Water law, *Water pollution control, Diversion, *Regional development, *Planning, *Canada, Water conservation, *Water demand, Water quality, Nonstructural alternatives, Potential water supply, Priorities.
Identifiers: Water information systems, Great Lakes Water Quality Agreement, Canada-Ontario Agreement, St. Lawrence River.

Attention to Canadian water resource management was precipitated by the pressure of United States demand for Canadian water resources and the public awareness of pollution dangers. The development of Canada's water resources and subsequent management are discussed. Factors such as conflicting demands, industrial and urban generated problems, disproportionate regional supplies and needs, absence of criteria and standards, and overlapping governmental jurisdictions, have necessitated the formulation of national policy and standards as well as activated citizen participation. Aspects and components of water development discussed include general characteristics of water, location of existing and potential supply sources, pollution problems (costs and forms), relationship with agriculture, and present inter-governmental control and efforts. The American and Canadian water issue is examined. Benefits from and objections to proposed water diversion schemes to export water to the U.S. and the Grand Canal plan to raise the level of the Great Lakes are presented. Improved and more responsible programs are suggested. Water resource planning is outlined in context of an economic, jurisdictional and institutional framework. Following a brief resume of past water conferences, an outline of regional priorities in water resource planning is presented. (Salzman-North Carolina)

THE BRANDYWINE: FIVE YEARS AFTER,
Pennsylvania Univ., Philadelphia. Inst. for Environmental Studies.
J. Benedict, and C. Wasserman.

February 1972. 102 p, 2 fig, 40 tab. EPA 16110EDC.

Descriptors: Ecology, *Urbanization, *Water management(Applied), *Watersheds(Basins), Water resources, *Water conservation, *Attitudes, *Land use, *Pennsylvania, Management, Alternative water use, Planning, Water quality, Water quality control, Water rights, Water utilization, Competing uses, Regulation, Natural resources, Water pollution, Watersheds(Basins), Land development, Habitat improvement, Water zoning.
Identifiers: Land use controls, *Brandywine watershed(Pa), Chester Co.(Pa), Brandywine Creek(Pa), Pollution, Development corporation.

The original Brandywine Creek Plan (Pennsylvania) would have used legal controls to regulate effects of spreading urbanization on the natural environment. However, citizens' disapproval precluded plan implementation. This report surveys residents' attitudes and changes in the Upper East Branch community, a prototype of a semirural area on the urban fringe, during the five years since the Plan's introduction. Three variables were studied: residents' perception of the area's growth, degree of community identification, and residents' perception of change in the natural environment. Many interviewees did not feel the natural environment changed over five years, and while most prefer the watershed to remain in its present state, a majority will accept some development, feeling that more residential growth is inevitable with older persons and farmers being replaced by younger people from urban areas. Residents were divided on whether mechanisms should be set up to handle problems before they arise or after problems occur. Residents were 2:1 against the Plan; those who believe their property will be directly involved were 3:1 against it. There is no relation between understanding of the plan and acceptance of it, and no social or demographic characteristics could be associated with acceptance of the plan. An increased awareness of the environment and the importance of protecting it seems to be the greatest long term impact of the Plan upon residents. A development corporation of local landowners could be considered for possible future use of the concepts of the Brandywine Plan. This would give landowners direct control over method, time, and place of development and control profits from sale of the corporation's holdings. (Grden-North Carolina)

EFFECTS OF AGRICULTURAL ACREAGE REDUCTION ON WATER AVAILABILITY AND SALINITY IN THE UPPER COLORADO RIVER BASIN,
Colorado Univ., Boulder. Dept. of Economics.
C. W. Howe, and D. V. Orr.
Water Resources Research, Vol 10, No 5, p 893-897, October, 1974. 4 tab, 2 fig, 8 ref.

Descriptors: *Colorado River, *Water policy, *Water rights, *Water management(Applied), *Salinity, *Desalination, Water supply development, Water quality, Irrigated land, Cost analysis, Costs, Economics, Economic impact, Water demand, Water yield improvement, Return flow, Model studies, Hydrologic models.

The increasing problems concerning the adequacy of water supply and water quality in the Upper and Lower Colorado River basins have created the need to explore alternative policies that can increase the efficiency of water use, reduce current consumptive uses, and improve water quality. Consideration is given to a policy that would reduce the amounts of irrigated acreage in the upper basin of the Colorado River thereby freeing water for alternative uses and reducing salt loadings. An analysis of costs, including estimates of regional income likely to be lost, indicated that a policy involving reduction in irrigated agricultural acreage compares favorably with other water augmentation and salinity reduction programs. (Mastic-Arizona)

PLANNING, MANAGEMENT AND ACCOUNTABILITY IN WATER RESOURCES RESEARCH,
Auburn Univ., Ala. Water Resources Research Inst.
J. C. Warman, and T. J. Joiner.
Available from WRRI, Auburn University, Auburn, Al. Price: $2.00. Available from the National Technical Information Service, Springfield, Va. 22161, as PB 239 413, $4.25 paper copy, $2.25 microfiche. Bulletin 21, November 1974. 54 p, 1 fig, 6 append, 25 ref. OWRT X-123(3748)(1)

Descriptors: *Planning, *Management, Water Resources, *Research priorities, Evaluation, Project planning, *Project purposes, *Project post-evaluation, *Project feasibility, Project benefits, *Universities.
Identifiers: *Accountability(responsibility).

This report focuses upon developing quality performance in water resources research through detailed attention to specific factors in program planning, management and accountability. University water resources research programs are problem oriented and are developed on an assessment of the needs of user groups. Two other factors condition this assessment wherever resources are limited and priorities must be established--value systems and policies. Both problems and objectives must be defined. Product objectives are defined in terms of knowledge gained resulting from the research while process objectives specify the research strategies to be followed in search of new knowledge. Other objectives include staff development, administration and communication. Teachers and researchers view their academic jobs as relatively free from authority; their relationships are associational rather than bureaucratic. There is a trend toward accountability; however, there generally is no way to effectively measure research productivity by conventional methods. The value of inputs cannot be directly compared with that of outputs. In this study evaluation means measuring achievement by utilizing controls devised and applied by the researcher to increase his personal effectiveness. The proposed control mechanism is designed to (1) define final and intermediate goals of the research project in terms of precise knowledge levels, (2) designate 'points of no return' for each knowledge level and (3) select checkpoints that trigger status reports indicating probability of achieving the required knowledge levels before their points of no return are reached.

A FRAMEWORK FOR UNCERTAINTY MANAGEMENT IN WATER RESOURCES PLANNING,
Decision Sciences Corp., Jenkintown, Pa.
D. F. Blumberg, J. A. Orlando, and A. B. Shostak.
Army Engineer Institute for Water Resources, IWR Contract Report 74-9, October 1974. 42 p, 10 fig.

Descriptors: *Risks, Water resources, *Planning, *Management, *Methodology, *Decision making, Effects, Floods, Damages, Economic impact, Streams, Evaluation, Forecasting, Costs, Alternative planning, Feasibility, *Flood control, Benefits.
Identifiers: *Risk analysis, *Decision theory, Sensitivity, Environmental impact.

A study has been made to develop a methodology to explicitly consider uncertainties--uncontrollable and unanticipated eventualities--that can adversely affect water resource planning. The study attempts to broaden the planning process by considering the changing nature of the environment for water resource planning and to provide a more efficient way to recognize uncertainties and anticipate their impacts prior to a decision to implement any specific actions. The ultimate purpose is to provide an anticipatory procedure that will help the planner avoid, where possible, the adverse consequences of unanticipated events. The management of uncertainty in water resource planning introduces a major choice involving risk taking: delay action and pay more (in time and resources) to further reduce uncertainty/risk, or take action now and accept the presence of uncertainty/risk. Described is the methodology for: (a) making this choice, recognizing the vital importance of the manager's perception of, and willingness to take, risk; and (b) development of procedures for structuring uncertainty, having made this choice. In essence, the methodology provides a quantitative basis for trading off resources (time and cost) to gain information versus the acceptance of uncertainty/risk. An example flood control problem is given. (Bell-Cornell)

THE ROLE OF WATER AND LAND RESOURCES IN ALLEVIATING MALNUTRITION AND HUNGER IN ARID REGIONS,
Bureau of Reclamation, Washington, D.C.
G. G. Stamm.
Presented at Deserts and Arid Lands Symposium, AAAS-CONYCT, Mexico City, 16 p, June 25-27, 1973. 5 fig, 1 tab, 6 ref.

Descriptors: *Human resources, *Water resources development, *Arid lands, *Crop production, *Technology, Irrigation, Agriculture, Water management, Irrigation systems, Land resources, Land management.

The lack of development and crop production in many arid lands of the world is a result of the absence of local technical knowledge and capital needed to explore for and tap water supplies. The first step, assuming that development and utilization of natural resources in these areas is desirable, would be the formation of a positive public policy directed toward providing more adequately for people in these dry areas. An inventory of the human resources as well as the type and amounts of water resources present is also necessary. A critical factor is what type of development system will be used to augment water supplies. Alternatives might include conventional storage and conveyance facilities, weather modification, sea or brackish water conversion, geothermal water production, increasing efficiencies of present systems of ground and surface water supplies, and transbasin water diversion. Trends indicate a rapidly increasing amount of malnutrition and hunger will prevail placing greater demands for world food production. Water development in arid areas is possible with present technologies, and consideration should be given to development of these areas to prevent migration to the already overburdened population centers and as a means of increasing world food supplies. THE URBAN REGION PLAN: SAINT JOHN, NEW BRUNSWICK), URBAN REGION IMPACT STUDY.
Proctor, Redfern, Bousfield and Bacon, Saint ohn (New Brunswick).
Draft copy. February, 1971. 288 p, 3 plates, 32 tab, append.

Descriptors: *City planning, *Comprehensive lanning, *Regional development, Governments, Land uses, *Regional analysis, Future planning, Canada, Cities, Urbanization, Education, Ecology, Highways.
dentifiers: Saint John, New Brunswick(Can), Kennebecasis River(Can), Saint John River(Can), Urban centers.

The first part of this report, The Region: Data Collection and Analysis, includes topographical and hysiographical features, population trends, employment distribution, present land uses, wildlife, gricultural production, recreation areas, and reional service facilities. Examination of potential egional water supply sources concludes that the Kennebecasis and/or Saint John Rivers could proide a water supply for the ultimate needs of the rea. Environmental quality of both water and air s analyzed. Municipal organization, finances, and ransportation systems and changing life styles are iscussed. Regional population projections inicate growth to 185,000 by 1987 for the Saint John Metropolitan Area. The Urban Region Plan (Part I) develops a concept to permit orderly growth, conomic and efficient provision of facilities and ervices, and the least disruption of the regional cology and rural economy. Principles incorporated are: concentration of urban uses in elected locations, linking centers with a network f high speed roads; and maintenance of a balance ith the environment. Existing situations, requireents and recommendations are presented for rban centers, open space network, water and ewerage systems, highway systems and educaon. (Salzman-North Carolina)

Identifiers: Automatic operational control, Network properties, System stress reduction.

It is difficult to justify investment in research and development to simply satisfy intellectual curiosity, so criteria should include an expectation of high cost-effectiveness and potential for widespread application of results. To establish a background for the research and applied development needs to be cited, basic procedures in planning, analysis, design and in automatic operational control are presented. Two broad programs were identified that probably would yield the greatest return on investment: (1) network properties and data requirements, and (2) system stress reduction. Effects of design expedients employed for simulation to approximate observed field conditions should be evaluated. Possibilities should be investigated for attenuating peak loads so that distribution-system component size could be reduced, thereby prolinging the life of existing facilities. Distribution planning is not the only realm in which attention is at a disparate scale to investment, but investment in distribution facilities represents over half of total water-utility costs. Other needs identified include: the role of water service in reviving declining communities, planning emergency service, hypothetical alternative designs of water services, determination of kinds and amounts of data needed for modeling, development of methods for system analysis, and development of methods for optimal operation of existing systems. Institute of Economic Growth, Delhi (India).
B. D. Dhawan.
Indian Journal of Agricultural Economics, Vol 28, No 2, p 59-67, April-June 1973. 4 tab, 1 ref.

Descriptors: *Water demand, *Irrigation water, *Elasticity of demand, *Linear programming, Governments, Least squares method, Water policy, Prices, Rainfall, Hydrologic data, Agriculture, Estimating, Equations, Mathematical models, Systems analysis, Time series analysis.
Identifiers: *Tube-wells, *India(Uttar Pradesh), *Multiple regression analysis, Crop pattern, Time series data.

Presented are some estimates of elasticity of demand for irrigation water with respect to four variables: (1) price of farm output; (2) price of irrigation water; (3) normal rainfall; and (4) deviation from normal rainfall. A single-eq(uation linear multiple regression model applied to the time series data in respect of State tube-wells in Uttar Pradesh is described. The model is estimated by the least squares method; the estimates suffer from the single-equation bias of an unknown magnitude. This study provides a basis for important policy implications: (1) The level of tube-well utilization is more sensitive to agricultural prices than to the prices of tube-well water: (2) irrigation water is seriously under-priced in India, with the Government incurring substantial losses in running the irrigation projects, and State tube-wells are no exception in this regard; (3) irrigation rates in relatively high rainfall areas must be relatively high for efficient utilization of the irrigation potential; and (4) the elastic relation between deviation from normal rainfall and demand for irrigation water suggests that large annual fluctuations in revenue receipts of a project can be dampened only be introducing an element of fixity in water rates: the introduction of a two-part tariff for tube-well water is a step in the right direction. (Bell-Cornell)

APPLICATION OF THE MAIN II WATER FORECASTING SYSTEM TO WYOMING COMMUNITIES,
Wyoming Univ., Laramie.
D. A. Quan.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 411, $4.25 in paper copy, $2.25 in microfiche. MSc Thesis, December 1973. 50 p, 20 tab, 28 ref, append. OWRT B-009-WYO(1).

Descriptors: *Wyoming, *Forecasting, *Water demand, *Water requirements, *Estimating, *Computer programs, Data collections, Computer models, Statistics, Municipal water, Water utilization, Sprinkling, Mathematical models, Systems analysis.
Identifiers: Sensitivity.

Reported is a project which tested the applicability of the MAIN II (Municipal and Industrial Needs) Water Forecasting System to five Wyoming, fairly typical western, communities: Cheyenne, Casper, Glenrock, Rock Springs, and Green River. MAIN II is a complex computer program that applies a number of equations to forecasting water demands and a library of water usage coefficients; for estimating water requirements, it employs mathematical models, unit use coefficients, and per capita coefficients. Errors found in the MAIN II program were corrected, and the program was modified to fit the existing data. Certain kinds of data were difficult to obtain for the five communities. Using a base year, forecasts were made and compared with actual water demands. Three optional MAIN II projection methods were tested: internal growth modeling, historical extrapolation of data, and external projection. Results showed the latter two methods to be fairly reliable. The internal growth models were not representative of Wyoming cities due to the atypical growth patterns of Wyoming communities as compared to those of the nation as a whole. Wyoming communities obtain their new water supplies from groundwater sources or by purchasing agricultural surface water rights from streams. The incremental cost for new water is considerable, and financially, therefore, it is vital to the community to be able to forecast water demands in advance of the needs as accurately as possible. Identifiers: *Delaware River Basin Compact, Regulatory power, Wetlands protection, Acquisition power.

An assessment of the Delaware River Basin Commission's (DRBC) progress and determination of its long-range needs is presented, including a discussion of its environmental enhancement and protection adequacy, power to abate and control pollution, methods to fund programs, and adequacy of enforcing powers. In the Delaware River basin, the existence and functioning of flood plains, marshes, and other wetlands are threatened by development, either directly or consequentially. No technique has yet been prefected to compare the value of water resource functions of the wetlands with the value of development that conflicts with these functions. This measuring technique is urgently needed. Meanwhile, the importance of these areas is established and warrants rapid, stringent action for their protection. DRBC has adequate planning and acquisition powers to protect the wetlands, but money for acquisition is not yet available. Ahigh priority is placed on protection of the water resource functions of the wetlands. Other suggestions for new DRBC involvement include planning, project review, indirect and direct regulation, stimulating action by other units of government, and various forms of purchase. However, the nature of the Commission depends on action by the federal government and the four states of New York, New Jersey, Pennsylvania and Delaware. (Grden-North Carolina)

Identifiers: *Adirondacks(N.Y.), Adirondack Park Agency(N.Y.), *Administrative agencies, *State policies, Compliance theory, Local compliance, Towns.

A regional resource planning and regulatory agency must be able to recognize the significance of local involvement to its survival and performance. The organizational theory and compliance nomenclature presented by Amitui Etzioni ('A Comparative Analysis of Complex Organizations' 1961) offers the agency a useful means by which to conceptualize its relationship with local governments, determine resource allocation schemes and assess its own performance. Recognition by an agency of the variation in local response to its programs and policies and of the variables predicting the nature of local involvement, would enable it to modify its involvement with local governments in a manner encouraging that compliance structure most amenable to agency goal attainment. Since State interest had historically been firmly established in the Adirondacks, thus paving the way for intervention, the policy issues associated with State-level land use control efforts have tended to emerge earlier in this region than elsewhere. Examining New York State's effort to institute land use regulations in the Adirondacks, those specific variables predicting the nature of town compliance were delineated. Agency performance was evaluated and potential constraints on long-range success were discussed.

RAILROAD AND CANAL COMPANIES--EMINENT DOMAIN (AS AMENDED),
Florida Sess. Laws, Vol 1, Ch. 74-47, p 44-45, approved May 17, 1974, effective immediately (1974). 2 p.

Descriptors: *Railroads, *Canals, *Eminent domain, *Condemnation, Legal aspects, Economics, Bridges, Lakes, Streams, Rivers, Gulfs, Oceans, *Florida, Legislation, Governments, Land use, Natural resources, Water law, Water resources development, Commerce, Compensation, Water management(Applied), Land management, Adoption of practices.
Identifiers: State policy, *Inverse condemnation.

This act relates to the special powers granted by the Florida legislature to railroad and canal companies. Any railroad or canal company which is or may become public carrier may condemn land surrounding any extension or terminal facility on any of the waters of any lake, river, bay, gulf or ocean. This condemned land may be used for depots, yards, switches, turntables, shops and storehouses. The carriers also have been granted the power to condemn any area in and over the waters for use as docks, wharves, elevators, ware or store houses, and all required facilities for the reception, retention, transfer, and forwarding of commerce. All enumerated rights shall be subordinate to the right of the governmental entity wherein the property is located to condemn said property through the exercise of its powers of eminent domain for a public purpose. COASTAL MAPPING ACT,
Florida Sess. Laws, Vol 1, Ch. 74-56, p 56-61, approved May 20, 1974, effective July 1, 1974. 6 p.

Descriptors: *Maps, *Florida, *Legislation, Recreation, Navigation, Administration, Administrative agencies, Planning, State governments, Boundaries(Property), Land tenure, Standards, Adoption of practices, Measurement, Monitoring, Legal aspects, Water law, Water policy, Public lands.
Identifiers: *Coastal zone, *Mean high water line, State policy, Coastal zone management.

Accurate maps of coastal areas are required for many public purposes, including but not limited to the promotion of marine navigation, the enhancement of recreation, the determination of coastal boundaries, and the implementation of coastal zone planning and management programs by state and local governmental agencies. The Legislature recognized the desirability of the confirmation of the mean high water line as the boundary between Florida state sovereignty land and uplands subject to private ownership. Uniform standards and procedures need to be developed with respect to the establishment of local tidal datums and the determination of the mean high-water and mean low-water lines. The powers and duties of the Florida Department of Natural Resources are spelled out including the responsibility of providing a comprehensive and continuous program of coastal boundary mapping which will permit accurate surveys. Upon the completion of a map or series of maps, a copy of the map is transmitted to the circuit court. Before a map becomes effective, the department is to hold a public hearing in the county where the land is located. (Sperling-Florida)

ZAHN, ET AL. V. INTERNATIONAL PAPER CO. (CLASS ACTION SEEKING DAMAGES FROM DISCHARGES),
1 Pollution Control Guide, Vol 3, paragraph 15025, p 15223-15232, 1974. 10 p.

Descriptors: *Judicial decisions, *Adoption of practices, *Legal aspects, *Jurisdiction, *Adjudication procedure, Water pollution, Lakes, United States, Federal government, Economic aspects, Water pollution sources, Water law, Legislation, Water quality control, Legal review, Federal jurisdiction, *New York, *Vermont.
Identifiers: Standing(Legal), Class action suits.

A class action suit was brought by owners and renters of Vermont property on Lake Champlain against a New York State pulpmill for having discharged wastes from its plant which polluted the lake. Damages were alleged based upon the depreciation of the value and the decrease of utility of plaintiffs' properties. The United States Supreme Court held that the failure of the unnamed class members to satisfy the minimum jurisdictional amount requirement for suits in the federal courts requires dismissal of the class action as to those persons. Even though the named plaintiffs satisfied the jurisdictional amount, $10,000, if the court concludes it is not feasible to define a class of property owners each of whom had such a claim, the Court may properly refuse to permit the suit to proceed as a class action. Aggregation of claims to satisfy the jurisdictional amount is not permitted. Any plaintiff who fails to satisfy the jurisdictional amount must be dismissed from the case, even though other individuals allege jurisdictionally sufficient claims. (Sperling-Florida)

AMENDING THE ACT OF JULY 4, 1955, AS AMENDED, RELATING TO THE CONSTRUCTION OF IRRIGATION DISTRIBUTION SYSTEMS.
Committee on Interior and Insular Affairs (U.S. Senate).
Senate Report No. 1244, 92nd Cong, 2d Sess. (1972).

Descriptors: *Irrigation, *Water distribution(Applied), *Legislation, *Drainage systems, *Government finance, Construction, Water supply, Legal aspects, Water reuse, Distribution systems, Federal government, Irrigation systems, Water conveyance, Water utilization, Water law, Administrative agencies, Administration.
Identifiers: Administrative regulations, *Congressional hearings.

The purpose of a bill relating to the construction of irrigation distribution systems is to amend the existing reclamation distribution system loan program. The amendment will bring irrigation drainage works and municipal and industrial water

supply works within the existing program. Also, the requirement for the transfer of title of lands to the United States for the duration of the loan has been deleted. The Distributions Systems Loan Act was enacted originally to provide a reclamation project, that has been authorized for construction by the Bureau of Reclamation, the local irrigation district, or other non-federal public entity, with a federal loan to construct the facility. In the seventeen years this program has been operating, eleven loans totalling seventy-four million dollars have been made. The committee unanimously endorses enactment of this bill. AQUATIC PLANT CONTROL.
Florida Sess. Laws, Vol 1, Ch 74-65, p 69-71, approved May 23, 1974, effective July 1, 1974. (1974) 3 p.

Descriptors: *Legislation, *Florida, *Aquatic weed control, *Aquatic life, Submerged plants, Natural resources, Water supply, Water resources, Water resources development, Federal agencies, Jurisdiction, Governments, Water law, Water pollution, Water pollution sources, Governmental interrelations, Administrative agencies, Weed control, Aquatic weeds, Biocontrol, Water quality control.
Identifiers: *State policy, Environmental policy.

This Act broadens the authority of the Florida Department of Natural Resources in controlling non-indigenous aquatic plants in the state. State participation on a matching basis with local agencies in funding non-indigenous aquatic plant maintenance programs is encouraged. The Act provides for annual reporting and fiscal accounting. The Department of Natural Resources is authorized to cooperate with the federal government in programs to control the growth of non-indigenous aquatic plants and other noxious aquatic plants. Cooperation between the Department of Natural Resources and the Game and Fresh Water Fish Commission in carrying out various plant control and maintenance functions is permitted. Included in the Act are definitions and a section relating to legislative intent. (Sperling-Florida)

A BRIEF HISTORICAL SURVEY OF FREEDOM OF THE SEAS,
P. Dees.
In: Sea Grant Publication UNC-SG-73-01, p 1-17, March, 1973. 88 ref.

Descriptors: *International law, *Law of the Sea, *International waters, *Foreign trade, *Oceans, Continental shelf, Geology, Navigation, Continental slope, Civil law, Common law, Jurisdiction, Governments, Treaties, Foreign waters, Resources development, Ships.
Identifiers: *Coastal zone management, International agreements, Territorial seas(Jurisdiction), Territorial waters.

From ancient times freedom of the seas has been enforced to maintain unrestricted commercial intercourse. The first maritime codes were the Hellenic Mare Clausum, the Rodian Sea Law adopted by the Romans in 51 B.C. and the Byzantine emperor Justinian's maritime provisions in Corpus Juris Civilis. With the advent of the Age of Discovery Most maritime nations were claiming sovereignty over parts of the open seas. Some influential persons, including Queen Elizabeth I and the Dutch legal scholar Grotius, protested this threat to international maritime freedom. Grotius is the acknowledged 'Father of International Law' for his work Mare Liberum. Although his ideal of freedom of the open sea was heatedly contested, steady progress was made toward that ideal and it was universally recognized by the beginning of the nineteenth century. It has evolved that the open seas are the territory of no state and therefore not subject to any state's legislation, administration, jurisdiction or police over parts of the open sea. The foundation of this doctrine is based on one of two mutually exclusive legal theories: first, the sea belongs to no one (res nullis) or second, the sea belongs to everyone (res communis). CRISIS IN THE SOUTH PACIFIC: TUNABOAT SEIZURES,
J. W. Abel.
In: Sea Grant Publication, UNC-SG-73-01, p 18-28, March 1973. 47 ref.

Descriptors: *International law, *International commissions, *Commercial fishing, *Treaties, *International waters, Law of the sea, Foreign trade, Governmental interrelations, Foreign waters, Fishing, Trespass, Water law, Penalties(Legal), Navigation, Oceans, Boundary disputes, Jurisdiction, Governments, Ships.
Identifiers: *Territorial seas(Jurisdiction), International agreements, *Territorial waters.

An area of major contention in international law is the breadth of a coastal nation's territorial waters. All attempts at codification of a generally accepted breadth of the territorial sea have failed. Thus claims range from a two-hundred mile to a three-mile limit. Chile, Ecuador, Peru and eight other Latin American (C-E-P) states have claimed a two-hundred mile territorial sea. This provoked the Truman Proclamations (1945) that sea and seabed resources contiguous to the United States might be subject to U.S. jurisdiction. C-E-P argues that the historical trend, economic self-preservation, and lack of established principles backup their claim of a 200-mile limit. The United States asserts these claims violate international conventions and established principles. The C-E-P states from 1961 to 1971 have seized 145 tuna vessels. This has resulted in great losses for the U.S. fishing industry, which is entitled by the Fisherman's Protective Act (FPA) to enter the territorial waters of another sovereign if in pursuit of tuna. The FPA contains provisions for the use of sanctions against foreign nations seizing U.S. vessels. (Dillingham-Florida)
W75-04649

JURISDICTION IN NATIONAL WATERS,
L. Allison.
In: Sea Grant Publication, UNC-SG-73-01, p 29-42, March, 1973. 104 ref.

Descriptors: *Jurisdiction, *International law, *Law of the sea, *Treaties, *Internal water, Foreign waters, International waters, Tariff, Water law, Public health, Sanitation, Ships, Harbors, Navigation, Straits, Inland waterways, Governmental interrelations, Oceans, Trespass, Penalties(Legal), Regulation, Foreign trade, Law enforcement.
Identifiers: *International agreements, *Territorial waters, Territorial seas(Jurisdiction).

There is a large body of laws concerning a coastal state's jurisdiction over foreign ships in its internal and territorial waters. Commercial ports are open to foreign ships though military bases are not. The 1958 Geneva Convention provided that internal waters are subject to the particular laws of the coastal state. For unlawful acts concerning only the internal order the coastal state of the ship may yield its jurisdiction to that of the ship's flag state. In a maritime claims case a municipal court has the power to detain a foreign merchant ship and attach it as security for the claim. Navigation and navigational aides to ships are under the control of the coastal state. A coastal nation exercises absolute police, customs regulation and revenue collection powers in its territorial waters, subject only to the right of innocent passage. Certain countries, the U.S.S.R. and the Peoples Republic of China included, generally follow these guidelines but occasionally overstep them. Other nations use their control of their territorial waters as an extension of foreign policy to sanction another nation by denying the other's vessels even innocent passage. The Arab States deny Israel access to the Straits of Tiran and Canada wishes to deny U.S. oil tankers passage to the North American Archipelago for fear of oil spills. (Dillingham-Florida)
W75-04650

AUTHORIZATION FOR SECRETARY OF INTERIOR TO ACQUIRE ADDITIONAL WETLANDS.
Committee on Merchant Marine and Fisheries (U.S. House).
H.R. Report No. 9823, 93d Cong, 1st Sess (1973).

Descriptors: *Federal government, *Legislation, *Government finance, *Adoption of practices, *Wetlands, Wildlife conservation, Administrative agencies, Administration, Economics, Inter-agency cooperation, Planning, Aquatic habitats, Land ownership, Land use, Right-of-way, Ecology, Water law, Water policy, Water management(Applied).
Identifiers: *Administrative regulations, *Congressional hearings.

The bill authorizes the Secretary of the Interior to issue certain obligations and to utilize the revenues to acquire additional wetlands. The wetlands to be acquired include additional waterfowl nesting and breeding grounds. The Secretary of the Interior is authorized to issue, and have outstanding, obligations which mature in less than ten years. The obligation shall bear such rate or rates of interest as determined by the Secretary of the Interior and approved by the Secretary of the Treasury. These obligations may be redeemable at the option of the Secretary of the Interior before maturity. The Secretary is also authorized to purchase any outstanding obligations under this section at any time and at any price. All obligations issued by the Secretary pursuant to this act are to be deemed exempt securities within the meaning of laws administered by the Securities and Exchange Commission. (Sperling-Florida)

A BILL TO ASSURE SAFE DRINKING WATER.
H.R. Rep. No. 5368, 93d Cong, 1st Sess. 1974. 20 p.

Descriptors: *Water purification, *Federal government, *Inter-agency cooperation, *Legislation, *Potable water, Water quality standards, Law enforcement, Penalties(Legal), Civil law, Federal jurisdiction, Regulation, Water quality, Water utilization, Water pollution, Water policy, Public health, Water distribution(Policy), Administrative agencies, Domestic water, Consumptive use, Water distribution(Applied), Water management(Applied), Adoption of practices, Water quality control.
Identifiers: *Administrative regulations.

This bill proposes to ensure safe drinking water by establishing standards of drinking water quality

nd by providing for adequate treatment, surveil-nce and maintenance of water treatment and dis-ibution facilities. The Environmental Protection gency shall establish primary standards to pro-ct public health and secondary standards to as-re esthetically appealing drinking water. The ates shall be responsible for enforcing the stan-rds. Willful violation and conviction will result either one year imprisonment or a $15,000 fine both per violation. Non-willful violation will be ble in a civil suit for not more than $10,000 per olation. Private citizens may commence a civil tion against any government agency for viola-n of the standards or for failure to perform any ty required by the Act. The Act provides for the PA to conduct research studies, and to render nancial and technical assistance to appropriate blic and private agencies conducting studies re-ted to drinking water quality and its effects. illingham-Florida)

HE BLOCKADE 'EXCEPTION' TO TERRI-ORIAL WATER JURISDICTION,
M. Martin.
: Sea Grant Publication UNC-SG-73-01, p 43-50, arch 1973. 42 ref.

escriptors: *Law of the sea, *Foregin trade, nternational law, *Governmental interrelations, ommon law, Legal aspects, Water law, Political pects, Jurisdiction, Governments, Navigation, eans, Foreign waters, Export, Import, Federal vernment, Foreign countries, Water policy, In-rnational waters.
entifiers: *Territorial seas(Jurisdiction), Coastal aters.

he international law of naval blockade is a curi-s exception to the basic notions of national vereignty over territorial seas, in that it permits e preemption of the adjacent state's right of ju-diction. Considered are the historical develop-ent of the naval blockade, its place within the mmon law, its use as an instrument of warfare d diplomacy, and its relevance to modern inter-tional law. The traditional common law doctrine blockade has lost most of its relevance and has en subsumed within international law. The two ost recent applications of the blockade by the ited States, the blockade of Cuba in 1962, and e 1972 blockade of North Vietnam, are used to ustrate the evolution of the blockade from a sim-e military tactic to an instrument of diplomatic pression. Modern technology has made it vir-ally impossible to maintain an effective shore ockade and still comply with internation law. odern blockades depend on having enough mili-y power to disregard the rule of law. Blockades the future will follow the style of the Cuban and etnamese blockades. (Deckert-Florida)

HE INTERNATIONAL SEABED REGIME: ROPOSALS AND PROSPECTS FOR REALIZA-ON,
M. Neal, Jr.
: Sea Grant Publication, UNC-SG-73-01, p 75-, March 1973. 58 ref.

escriptors: *Beds under water, *Oceans, wnership of beds, Jurisdiction, Water law, eology, Submerged lands, International law, ited Nations, Regime, Bottom sediments, Min-g, Mineral industry, Mining engineering, Inter-tional water, Governmental interrelations, doption of practices, Regulation, Enforcement.
Identifiers: *Seabed mining, *International agreements.

The prospective development of an international seabed regime to regulate international use of the ocean floor is discussed. The regime is chiefly concerned with the commercial aspects of seabed development, mining being of foremost interest. Due to the new developing capital technology and the bugeoning population, the earth's natural resources are being depleted, and man must look for new sources of raw materials. Because interest in the deep seabeds as a source of raw materials is increasing, there has emerged a great need for the establishment of applicable law. In 1968 the United Nations declared that seabed exploitation should be carried out for the benefit of mankind. The General Assembly has more recently buttressed this stand by refusing to honor national ownership of seabed areas, and terming it an international area. In 1974, a Law of the Sea Conference is to be convened to establish international machinery for seabed regulation. All countries taking part agree that in general mankind should benefit. The Conference, however, may be cancelled for a general lack of preparation. Problems with reference to seabed development are great. Questions exist as to the relation of the international seabed and the respective authority of related agencies comprising the seabed regime. (Sperling-Florida)

THE MARINE ENVIRONMENT AND TOXIC SUBSTANCES (WHEN WAS THE LAST TIME YOU HAD A GOOD SWORDFISH STEAK),
B. W. Pittman.
In: Sea Grant Publication, UNC-SG-73-01, p 82-97, March 1973. 67 ref.

Descriptors: *Water pollution, *Oceans, *International law, *Legal aspects, *Adoption of practices, Water law, Oil pollution, Heavy metals, Pesticides, Ecology, Environmental effects, Jurisdiction, Government, Water resources, Biota, Water pollution sources, Water quality, Water quality control, Marine fisheries, Evaluation, Pollution abatement.
Identifiers: International agreements, *Territorial waters, Territorial seas(Jurisdiction).

Man knows little about the ocean's vital resources, and he creates serious problems of marine pollution, particularly with respect to the impact of toxic substances on the marine biota. The problem of marine pollution is both national and international in scope. Most of the pollution of prime marine habitat is caused by land-based activities such as industrial and domestic waste disposal. Effects, however, are not local. Ocean currents and atmospheric conditions tend to cause pollution created by one nation to invade the territorial waters of other nations. Oil, heavy metals, and chlorinated hydrocarbons are the principal sources of pollution. Other sources include dumping, shipping and man's exploitation of marine resources. These pollutants have both short and long term adverse effects. The building of an applicable legal system for protecting the sea may be started by national legislation. Each nation must assume the responsibility of enforcing pollution regulations within its territorial waters. Unilateral action alone will not suffice. International solutions must be found. Several international organizations have been created to research the marine problem. Longterm solutions must include public education, a redirection of world thinking and a study of the population explosion. (Sperling-Florida)
W75-04768

THE DISPOSAL OF RADIOACTIVE WASTES INTO THE SEA: SOME INTERNATIONAL LEGAL CONSIDERATIONS,
G. A. Planer.
In: Sea Grant Publication UNC-SG-73-01, p 98-107, March 1973. 26 ref, 2 append.

Descriptors: *Radioactive waste disposal, *Nuclear wastes, *Water pollution sources, Industrial wastes, Economics, Safety, Radioactivity techniques, International law, Environmental control, Population, Productivity, Environmental effects, Radioactivity effects, Environmental sanitation, Disposal, Waste disposal, Waste storage, Federal jurisdiction, Oceans, Lakes.
Identifiers: *International agreements, *Absolute liability, *Hazardous substances(Pollution).

The development and increasing use of nuclear energy for the generation of electric power, and the expanding applications or radioisotopes in research, industry and medicine, are unavoidably associated with the production of unwanted by-products in the form of complex mixtures of radioactive elements. These by-products, called fission products, present serious problems in terms of their safe disposal. The most important consideration in the treatment of such waste is preventing its return to the environment and injuring man either directly through contact or indirectly through contamination of the food and water supplies. The economic pressure to increase release of contaminants into the environment and to treat as little of the wastes as possible has to be countered by safety considerations which limit the quantity that can be released safely. Two main philosophies of waste disposing are in competition. The first is to concentrate and contain the gas, liquid, or solid waste in such a way that it is at all times under complete control. Harm to the environment or property resulting from release of radioactive contaminants might give rise to a theory of international absolute liability for non-complying nations. A second suggestion is that regulations should be formulated establishing disposal limits for each site individually instead of enacting blanket regulations governing all disposal sites. Recommendations are made to insure the safe disposal of radioactive wastes into both fresh waters and the seas. (Sperling-Florida)
W75-04769

THE LAW OF MARITIME OIL SPILLS,
J. Pendergrass.
In: Sea Grant Publication, UNC-SG-73-01, p 108-118, March 1973. 30 ref.

Descriptors: *Oil pollution, *International law, *Oceans, *Pollution abatement, *Environmental effects, Pollution, Sea water, Oil industry, International waters, Oil wastes, Water pollution sources, Water law, Jurisdiction, Oil spills, United Nations, Water pollution control, Pollution control, Adoption of practices, Waste disposal, Federal government.
Identifiers: *Energy crisis, International agreements, Territorial seas(Jurisdiction).

The problem of oil pollution and its demand for an international solution are described. In the present state of world technology, oil is the principal source of energy. As a result of irregular distributions of oil deposits, massive shipping has been required to transport oil to industrial nations from relatively underdeveloped countries containing the richest deposits of oil. The world's oceans are deteriorating under the increasing strain of oil discharges. Considering the present state of oil pollution and energy needs, a legal solution must be developed. The United Nations' Inter-Governmental Maritime Consultative Organization prepared a treaty to permit governments to deal with oil pollution consequences and another treaty dealing with the question of civil liability for oil pollution damage. After discussion, the representatives of the Organization chose absolute liability with certain defenses as the scheme for establishing responsibility and the owner as the entity on whom such liability is placed. Jurisdiction on civil liability allows an action based on pollution damage to be brought in the courts of the contracting states where damage has been sustained or preventative measures taken. In 1972 the London Convention sought to limit waste dumping at sea. (Sperling-Florida)

W75-04770

AFRICAN ATTITUDES TOWARD THE LAW OF THE SEA,
P. Carruth, Jr.
In: Sea Grant Publication UNC-SG-73-01, p 166-177, March 1973. 35 ref.

Descriptors: *Continental shelf, *Water resources, *Law of the sea, *Boundaries(Property), *Water resources development, Oil industry, Water law, Legislation, Political aspects, Economic aspects, Minerals, Governments, International law, Conservation, Fishing, Social aspects, Legal aspects, Natural resources.
Identifiers: *International agreements.

Nations along the Gold Coast of Africa, such as Ghana, have taken extra measures to protect the wealth that might lie beneath the waters on the extended continental shelf. The Ghana Fishery Conservation Zone presently extends twelve miles off the coast and the territorial continental shelf is restricted to a hundred miles. However, a 1968 law established the territorial seabed at 100 fathoms with an extension to a depth capable of exploitation. Control of coastal oil reserves is one of the possibilities contemplated in this action. The Ivory Coast has analogous legislation. Kenya, Tanzania, and Liberia all have laws similar to other coastal states, those retaining the twelve mile limit. The Nigerians changed their limit in 1971 from twelve miles to thirty. Massive aid for development and offshore oil deposits are said to have prompted this action. The Nigerian government thinks that it will be able to enforce this boundary and that the country is able to develop this resources in some way economically beneficial to Nigeria. Sea laws that deal with other than local territorial issues are virtually non-existent. (Sperling-Florida)
W75-04771

BILL TO ESTABLISH THE POTOMAC NATIONAL RIVER IN THE STATES OF MARYLAND, VIRGINIA, WEST VIRGINIA, AND THE DISTRICT OF COLUMBIA AND FOR OTHER PURPOSES.
H. R. Rep. No 12785, 93d Cong, 2d Sess. (1974).

Descriptors: *Rivers, *Adoption of practices, *Federal government, *Aesthetics, *Administrative agencies, Administration, Regulation, Virginia, West Virginia, Maryland, Wildlife conservation, Land tenure, Condemnation, State governments, Decision-making, Legislation, Administrative decisions, Eminent domain, Land management, Water resources development.
Identifiers: Administrative regulations.

This is a bill to establish the Potomac National River in the states of Maryland, Virginia, West Virginia, and the District of Columbia. The river and the adjacent land area possess unusual natural, scenic, historic, fish and wildlife, and recreational values. To effectuate this act the Secretary of the Interior is authorized to acquire by donation, purchase or transfer from any other federal agency, land or property interests in the area. The boundaries of the national river shall not include more than fifty thousand acres. Property owned by any state or political subdivision thereof may be acquired only by donation. Federal property located within the boundaries may, with the concurrence of the head of the administrating agency, be tranferred to the administrative jurisdiction of the Secretary without a transfer of funds. The Secretary's authority to acquire property by condemnation within the national river shall be suspended for five years. The Secretary may exclude from the suspension any properties under immediate threat of development. (Sperling-Florida)

SOIL CONSERVATION--ADMINISTRATION OF DEPARTMENTS AND CONSERVANCY DISTRICTS.
Iowa Legislative Service, House File 1178, Vol 3, p 292-297, approved May 27, 1974 (1974). 6 p.

Descriptors: *Iowa, *Legislation, *Adoption of practices, *Administration, *Erosion control, Soil conservation, Legal aspects, Soil erosion, Sediment control, Administrative agencies, Decision making, Erosion, Conservation, Land tenure, Regulation, Sedimentation, Sedimentation rates, Administrative decisions, Land management, Water resources development, Surface runoff.
Identifiers: *Administrative regulations, Notice, Nuisance(Legal aspects).

This act relates to the administration of the department of soil conservation, soil conservation districts and conservancy districts in Iowa. The commissioners of any soil conservation district will inspect any land within the district, upon the receipt of a signed complaint, from an owner or occupant of land being damaged by sediment, that soil erosion is occurring in excess of the limits established by the district soil erosion control regulations. If they find that sediment damages are occurring they will issue an administrative order to the landowner, and to the occupant of the land. The order will state as nearly as possible the extent to which soil erosion exceeds the limits established by the district's regulations. The commissioners and their agents have authority, after giving ten days written notice, to enter upon any land without consent to determine whether soil erosion is occurring in violation of the regulations. (Sperling-Florida)
W75-04773

WATERWORKS DEPARTMENT IN CERTAIN CITIES.
Acts of Indiana, Public Law No 81, S. 33, Approved February 21, 1974, Ch. 6.5, p 313-322 (1974). 10 p.

Descriptors: *Indiana, *Legislation, *Adoption of practices, *Administrative agencies, Budget, Contract administration, Decision making, Economic aspects, Eminent domain, Water supply, Water shortage, Public health, Safety, Treatment facilities, Water supply development, Water policy, Water yield, Water purification, Water quality control, Water quality standards.
Identifiers: *State policy.

This Indiana law concern's water works districts in certain cities under Waterworks Department. It defines powers and provides for the imposition of a tax and the issuance of bonds. A waterworks board will be created and composed of five persons appointed by the mayor. They will supervise the waterworks department, which is responsible for the management, control and operation of the filtration and delivery of water within the waterworks district. The waterworks department may prepare budgets for the district. The department may award contracts for the purchase of capital equipment or other property or for the construction of capital improvements. The department may exercise the power of eminent domain. The department will have power to act when it finds existing waterworks are insufficient to furnish a supply of water necessary to protect the public health and safety. The Department may also repair or construct new facilities as necessary. The board must provide an estimate of the cost, specifications, and a description of property rights which are to be acquired. (Sperling-Florida)

UNION OF CONCERNED SCIENTISTS V. ATOMIC ENERGY COMM'N. (REVIEW OF ORDERS OF AEC LICENSING NUCLEAR POWERPLANT).
499 F. 2d 1069 (D.C. Cir. 1974).

Descriptors: *Judicial decisions, *Legal aspects, *Nuclear powerplants, *Water cooling, *Regulation, Licenses, Standards, Thermal pollution, Adoption of practices, Water pollution sources, Engineering structure, Environmental engineering, Administrative agencies, Environmental effects, Design criteria, Specifications, Adjudication procedure, Federal government, Administrative agencies, Administrative decisions.
Identifiers: *Environmental impact statement, *Energy crisis, *Administrative regulations.

This case in the District of Columbia Court of Appeals was an action on petition for review of orders of the Atomic Energy Commission issuing an operating license for a nuclear power station. The court held that the atomic safety licensing board does not have an affirmative duty to evaluate the correctness, rather than the sufficiency of support for uncontested findings. By granting a full-power operating license for a nuclear power plant without first resolving challenges to the interim acceptance criteria for emergency core cooling systems, the commission did not deprive the environmental protection group of due process, violate its own regulations, or abuse its discretion. The commission, it was found, did not act unreasonably in the preparation of a final environmental impact statement prior to the issuance of a license, as well as in the interim acceptance criteria for emergency core cooling systems. (Sperling-Florida)

IN RE HIGHWAY US-24, IN BLOOMFIELD TOWNSHIP, OAKLAND COUNTY (HIGHWAY CONDEMNATION PROCEEDING).
220 N.W.2d 416 (S. Ct. Mich. 1974).

Descriptors: *Eminent domain, *Michigan, *Judicial decisions, *Legal aspects, Environmental control, Water pollution, Water quality, Water law, Legislation, Environmental effects natural resources, Water quality control, Conservation, Adoption of practices, State governments, Water quality standards, Adjudication procedure, Water resources development, Highways, Condemnation.
Identifiers: *Administrative regulations, *State policy.

The Circuit Court held the Highway Condemnation Act unconstitutional as denying due process of law. The Supreme Court reversed holding the Act not to be unconstitutional either as a denial of due process through lack of adequate standards or as a failure to comply with a Michigan constitutional requirement to protect the state's natural resources. The Michigan Constitution states that the legislature must provide for protection of water and other natural resources of the state from pollution, impairment, and destruction. The court, however, held that the legislature is not under a duty to specifically include environmental protection provisions in all relevant legislation. The Environmental Protection Act of 1970 is the chief legislative enactment which fulfills the legislature's duty under the state constitution to protect natural resources. (Sperling-Florida)

PROCEDURAL METHODS FOR IMPLEMENTING COLORADO RIVER WATER CONSERVATION MEASURES.
Bureau of Reclamation, Washington D.C.
Federal Register, Vol 37, No 174, p 18076-18078, September 7, 1972.

Descriptors: *Regulation, *Colorado River, *Water conservation, *Boulder Canyon Project Act, Administrative agencies, Water distribu-

ion(Applied), Water resources, Water resources levelopment, Water utilization, Water delivery, Distribution patterns, Distribution systems, Water lemand, Water supply, Water requirements, Water contracts, Water law, Legal aspects, Water llocation(Policy), Water rights, Federal governnent, Planning.
dentifiers: Administrative regulations.

The principal purpose of this revision is to specifially include Indian reservations and federal stablishments in the group of water users equired to follow water conservation practices, nd to provide more positive language to ensure hat all water users are properly notified of deterninations and have an opportunity to appeal. The rocedures established shall apply to every public r private organization in Arizona, California or Nevada which, pursuant to the Boulder Canyon roject Act or to provisions of other Reclamation aws, has a valid contract for the delivery of Colorado River water, with certain exceptions. The Regional Director of the Bureau of Reclamaon shall consult with each user prior to making nnual recommendations relating to water conseration measures and operating practices in the iversion, delivery, distribution and use of Colorado River water. Consultations shall also recede the Regional Directors determination of ach user's estimated water requirements for the nsuing calendar year so that deliveries of Colorado River water under this program will not revent delivery of other authorized distributions. ERGEN COUNTY SEWER AUTHORITY V. ACKENSACK MEADOWLANDS DEVELOPIENT COMMISSION (SEEKING DECLARATOY JUDGMENT THAT PLAINTIFF NOT SUBECT TO LAND USE REGULATIONS OF DEENDANT IN CONSTRUCTING ADDITION TO EWAGE PLANT).
24 A.2d 108 (Sup. Ct. N.J., 1974).

escriptors: *New Jersey, *Judicial decisions, Regulation, *Jurisdiction, *Land use, *Permits, ublic utility districts, Utilities, Water law, Legal spects, Administrative agencies, Administration, aw enforcement, Environment, Local governents, Environmental control, Land resources, eservation, Sewage treatment, Water pollution ources, Zoning control, Legislation, Non-structal altenatives, Legal review, Adoption of pracces.
entifiers: *State policy, *Injunctive relief, Administrative regulations, Declaratory dgment, Environmental policy.

aintiff public corporation brought action seeking declaratory judgment that it was not subject to e land use and building regulations promulgated the defendant, also a public corporation. The aintiff, without prejudice to any claim that the fendant lacked jurisdiction over the plaintiff, plied for and was granted a building permit and ning certificate by the defendant with respect to ditions being made to one of plaintiff's sewage eatment facilities. The plaintiff failed to comply th certain conditions attached to the permit and e defendant countered the plaintiff's action with request for injunctive relief against the violaons. Ruling on the defendant's motion, the Suior Court of New Jersey held that the plaintiff as clearly a county agency or instrumentality thin the mandate of the Hackensack eadowlands Act and thus was subject to the gulatory jurisdiction of the defendant. The court ued an injunction against further construction by the plaintiff in violation of the conditions imposed by the permit. (Deckert-Florida)

INCORPORATED VILLAGE OF CORNWALL V. ENVIRONMENTAL PROTECTION ADMINISTRATION OF THE CITY OF NEW YORK (VILLAGE SEEKING ANNULMENT OF WITHDRAWAL OF CONDITIONAL APPROVAL FOR INTERCONNECTION WITH AQUEDUCT FROM UPSTATE WATERSHED AND ISSUANCE OF FINAL APPROVAL OF APPLICATION).
358 N.Y.S.2d 459 (S. Ct. App. Div. 1974).

Descriptors: New York, *Judicial decisions, *Water supply, *Governmental Interrelations, *Legal aspects, Permits, Local governments, State jurisdiction, Regulation, Administration, Legislation, Electric powerplants, Water transfer, Reservoirs, Water conveyance, Water demand, Water allocation(Policy), Water distribution(Applied), Water law, Legal review, Water supply development, Municipal water, Aqueducts, Adjudication procedure, Water policy, Water management(Applied), Administrative decisions.
Identifiers: *Water rights(Non-riparians), *Administrative regulation.

Petitioner, municipality, sought to have the withdrawal of conditional approval for the petitioner's interconnection with the Catskill aqueduct by the respondent, municipal agency, appellant herein, annulled and sought to have the respondent required to issue final approval for the tie-in. The tie-in was required for the petitioner's planned transfer of its municipal reservoir to a private utility as part of the utility's plan for constructing an electric power plant. The petitioner had expended over one million dollars to effectuate the tie-in. The lower court granted the petition and appeal was taken. The appellant contended that it had the right to deny the petitioner's tie-in application. The Supreme Court of New York, Appellate Division, disagreed and affirmed the lower court ruling. The court ruled that the Water Supply Act did not give the appellant the right to deny the petitioner's application in order to keep it from transferring its reservoir to the utility, and the appellant could not collaterally attack a prior federal court judgment holding that the power plant project would not jeopardize the appellant's water supply. (Deckert-Florida)

HENDRIX, ET AL. V. CREEL, ET AL. (ACTION FOR INJUNCTION TO COMPEL MUNICIPAL CORPORATION TO CLEAR AND MAINTAIN DITCH).
297 So. 2d 364 (Ala. 1974).

Descriptors: *Alabama, *Judicial decisions, *Drainage, *Ditches, *Legal aspects, Surface runoff, Adjacent land owners, Water law, Land tenure, Repulsion(Legal aspects), Easements, Legal review, Surface waters, Streams, Real property, Overland flow, Runoff, Local governments, Drainage effects, Flood protection, Prescriptive rights, Common law, Public rights, Adjudication procedure.
Identifiers: *State policy, *Public trust doctrine.

Plaintiff landowners sought injunctive relief compelling the defendant municipality to clear and maintain a drainage ditch which ran across the properties of the plaintiffs and of the defendant adjacent landowners and to restrain the defendant landowner from impeding the flow of the ditch. The ditch was a well-defined ditch or watercourse which, for over 20 years, had been maintained as a drainage ditch by the defendant municipality. The plaintiffs contended that the municipality had acquired a drainage easement across the plaintiff landowners' property by prescription, and that the municipality owed a duty to the plaintiffs and the public to maintain the ditch. The lower court sustained the defendants' demurrers, and the plaintiffs appealed. The Alabama Supreme Court affirmed the lower court ruling and held that the ditch was not of the character of defined stream to which rights attach that are not applicable to surface waters; that the municipality did not gain a prescriptive easement through its prior maintenance of the ditch; and that the municipality had no duty to maintain proper drainage of surface water from the plaintiffs' property. (Deckert-Florida)

JURISDICTION OF SUBMERGED LANDS--GUAM, THE VIRGIN ISLANDS AND AMERICAN SAMOA.
Hearings on H.R. 6775, 4696 and 6135, Subcomm. on Territorial and Insular Affairs, Comm. on Interior and Insular Affairs, 93d Cong, 1st Sess, September 25, 1973. 80 p.

Descriptors: *United States, *Legislation, *Jurisdiction, *Political aspects, Submerged land, Tidal waters, Measurement, Accretion(Legal aspects), Land reclamation, Oil, Petroleum, Boundaries(Property), National parks, Land use, Land tenure, Land management, Land development, Federal government, *Virgin Islands, *Guam.
Identifiers: *American Samoa.

A report is presented of hearings before the Subcommittees on territorial and insular affairs of the United States House of Representatives. They are considering legislation which would place certain submerged lands within the jurisdiction of the governments of Guam, the Virgin Islands, and American Samoa. The bill transfers the interest of the United States in lands permanently or periodically covered by tidal waters, but not above the mean high-tide line, seaward to a line three miles distant from the coastline. This coastline is to be measured as including any modification by accretion, erosion, reliction, and in artificially made, filled-in, or reclaimed lands. Excepted from this transfer are all deposits of oil, gas, and other minerals, not including coral, sand, and gravel. Also excepted are all adjacent property owned by the United States above the line of the mean high tide, any parcels with structures constructed by the United States, lands administered under the National Park Service, and any lands the President may designate within four months of this legislation's enactment. (Sperling-Florida)

OFFSHORE OIL DRILLING AT SANTA BARBARA, PART 1,
Hearing--Subcomm. on Mines and Mining, Comm. on Interior and Insular Affairs, U.S. House of Representatives, 93d Cong, 1st Sess, November 17, 1973. 162 p.

Descriptors: *Legislation, *Federal government, *Oil industry, *Submerged Lands Act, *Continental shelf, Marine geology, Oceans, Pacific Ocean, Oil pollution, Water pollution, Water pollution control, Oil spills, Oil, Fuels, Natural gas, Navigation, Energy, Shores, Resources development, *California, Adoption of practices, Environmental effects, Social benefit.
Identifiers: *Coastal zone management, *Congressional hearing, Navigational obstructions, Santa Barbara(Calif).

Bills limiting oil production in the Santa Barbara Channel were considered in a hearing before the Subcommittee of Mines and Mining of the Committee on Interior and Insular Affairs in Santa Barbara, California, in November 1973. Local citizens expressed their view that future oil drilling and production in the Channel must be considered as a balance between the need for oil and the need to regulate the environmentally and navigationally hazardous methods of retrieving the oil. Past attempts have resulted in damaging oil spills. In leasing resource rich lands to the oil industry the sub-

committee feels that the government has the right to impose environmental safety standards on industry operations in the seismically unstable area. The three bills would establish a federal ecological preserve on a portion of the outer continental shelf in the Santa Barbara Channel; provide for a moratorium on drilling operations pending the development of technology to control and prevent pollution by oil discharges; and to improve methods of oil production from the submerged lands. Specific regulations are set out for termination of leases, the amounts of compromise settlements, and terms to be met to resume oil drilling. (Dillingham-Florada)
W75-04784

AMENDING THE NATIONAL ENVIRONMENTAL POLICY ACT OF 1969, TO PROVIDE FOR A NATIONAL ENVIRONMENTAL DATA SYSTEM.
Washington D.C., Committee on Interior and Insular Affairs (U. S. Senate).
Senate Report No 945, 92d Cong, 2d Sess (1972).

Descriptors: Environmental effects, *Data collections, Data storage and retrieval, *Legislation, *Ecology, Automation, Administration, Administrative agencies, Adoption of practices, Legal aspects, Water resources development, Land management, Federal government.
Identifiers: *National Environmental Policy Act, *Congressional hearings.

A proposed congressional amendment to the National Environmental Policy Act of 1969 (NEPA) provides for a national environmental data system. An appropriate network of new and existing information processing or computer facilities will be established. The facilities, both private and public, will be located in various areas of the United States and interconnected through a system of communication with a central facility for input, access and general management. Ancillary software and support services required for effective information system operation are also funded. State or regional environmental centers are to support research, education, planning and land and water management of activities necessary to improve environmental quality. Provisions for the purchase of Klamath Indian Forest lands are included. The purpose of the amendment is to bridge the weaknesses of NEPA in reference to accessibility of environmental data. The Committee on Interior and Insular Affairs endorses the amendmentment and recommends passage. (Sperling-Florida)
W75-04785

NUECES RIVER PROJECT, TEXAS, PART 1.
Hearings--Subcomm. on Water and Power Resources, Comm. on Interior and Insular Affairs, U.S. House of Representatives, 93d Cong, 1st Sess, November 10, 1973. 75 p.

Descriptors: *Texas, *Regional development, *Legislation, *Water resources development, *Public benefits, Government, Legal aspects, Water law, Regulation, Planning, Administration, Reclamation, Regional analysis, Resource allocation, Social aspects, Environmental policy, Water quality, Dam construction, Engineering, Water allocation(Policy), State governments, Federal government, Water management(Applied).
Identifiers: *Congressional hearings, State policy, Private interest groups, Nueces River(Tex).

The bill authorizes the Secretary of the Interior to construct, operate, and maintain the Nueces River Project in Texas and other affiliated projects. Included in the hearing transcript is the text of the bill under consideration. The subcommittee heard testimony dealing with regional reclamation as part of the basin project, water resource planning, and reports submitted by administrators of municipal and county water districts. The hearing also deals with the considerations created by concurrent jurisdiction and differing water policies of various local governments affected by the basin project. To achieve regional water resource planning, local areas have established regional planning commissions and councils of local governments to facilitate intergovernmental responses to regional problems. Resolutions submitted by local municipalities endorsing regional planning and construction, and input of private citizens are included. (Sperling-Florida)
W75-04786

AUTHORIZING THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE EAST GREENACRES UNIT, RATHDRUM PRAIRIE PROJECT, IDAHO, AND FOR OTHER PURPOSES.
Committee on Interior and Insular Affairs (U. S. House).
H. R. Rep. No. 987, 91st Cong, 2d Sess (1970).

Descriptors: *Idaho, *Legislation, *Irrigation system, *Water supply, *Water resources development, Multiple purpose projects, Government finance, Recreation, Wildlife conservation, Water sources, Groundwater management, Consumptive use, Economic aspects, Water distribution(Applied), Stream channels, Judicial decisions, Legal aspects, Water conservation, Recreation, Public benefits.
Identifiers: Water rights(Non-riparian), *Administrative regulations.

A report is presented on a bill authorizing the Secretary of the Interior to construct, operate and maintain several projects in Idaho. These projects have multiple purposes of irrigation, municipal and industrial water supply, fish and wildlife enhancement, and recreation. These purposes would be accomplished through the development of a groundwater supply for irrigation to relieve that drain upon Twin Lakes. The community is in need of an adequate and assured water supply for its irrigable lands and domestic use. With such a supply the regional dairy industry could survive. The existing supply of water, obtained from Twin Lakes, is delivered through natural stream channels and poorly maintained open gravity ditches. Serious losses of water are incurred in transit to the lands. The use of Twin Lakes has been further reduced by a decision by the Idaho Supreme Court which limits variation of the water level of Twin Lakes within the range of four feet. (Sperling-Florida)
W75-04787

INTERIM NUCLEAR LICENSING.
Committee on Merchant Marine and Fisheries (U. S. House).
H.R. Rep. No 991, 92d Cong, 2 Sess. (1972).

Descriptors: *Legislation, *Federal government, *Nuclear powerplants, *Permits, Administrative agencies, Supervisory control(Power), Water law, Legal aspects, Regulation, Administration, Nonstructural alternatives, Water quality control, Water pollution sources, Ecology, Electric power production, Environmental control, Interagency cooperation, Water pollution control, Administrative decisions, Environmental effects, Thermal pollution.
Identifiers: Licenses, *National Environmental Policy Act, *Congressional hearings, Administrative regulations, *Environmental impact statements.

The Committee on Merchant Marine and Fisheries, to whom this bill was referred, reported favorably and recommended passage of the amendments to the National Environmental Policy Act of 1969. The purpose of this legislation is to provide interim authority to the Atomic Energy Commission (AEC) to permit the operation of certain nuclear power generating facilities for testing and emergency purposes. This authority applies only to those facilities which have already been constructed under a valid AEC construction license and which lack only an operating license to begin generating electrical power. The AEC may issue such a license only after consultation with the Council on Environmental Quality and the Environmental Protection Agency. The AEC must take environmental consideration into account when issuing a permit. Any permits issued under the authority of this bill would terminate either upon the end of the AEC's NEPA review process or in October 1973. In addition, the AEC has specifically reserved the power to require backfitting of cooling and other facilities at a later date, following full and unabbreviated NEPA review. (Deckert-Florida)
W75-04788

AUTHORIZING THE CITY OF SHERMAN, TEX., TO CONSTRUCT A BARRIER IN DENISON DAM (LAKE TEXOMA) RED RIVER, TEX. AND OKLA., FOR THE PURPOSE OF PROVIDING A MUNICIPAL AND INDUSTRIAL WATER SUPPLY.
H.R. Rep. No 989, Comm. on Public Works, 91st Cong, 2d Sess, April 8, 1970. 3 p.

Descriptors: *Water supply, *Legislation, Dams, *Water storage, *Industrial use, Consumptive use, *Texas, *Oklahoma, Federal government, Economic aspects, Legal aspects, Water resources development, Flood protection, Electric power plants, Recreation, River, Water level, Water distribution(Applied), Navigable waters, Construction, Water conveyance, Water costs, Water conservation, Water law, Public benefits.

A report is presented on a bill authorizing the City of Sherman, Texas, to construct a dam to sub-impound an arm of Denison Dam Lake, Red River, Texas and Oklahoma. The purpose of the sub-impoundment is to provide a municipal and industrial water supply. The bill was reported favorably with amendments. The dam will separate the Big Mineral Arm from Lake Texoma to provide water for Sherman. The proximity of this location to the city would minimize the cost of a transmission line. Population growth expected to the north and northwest makes the site further desirable for a water supply source. This sub-impoundment will not appreciably affect the operation of Denison Dam for the purpose of flood control, hydroelectric power or recreation. Because Lake Texoma constituted navigable waters of the United States specific legislative authority for the construction of a dam is required. The city will reimburse the United States the cost allocable to an amount of storage in the Lake equal to the sub-impoundment, including the loss of power revenues attributable to the sub-impoundment. (Sperling-Florida)
W75-04789

AUTHORIZING THE SECRETARY OF THE INTERIOR TO CONSTRUCT, OPERATE, AND MAINTAIN THE TOUCHET DIVISION, WALLA WALLA PROJECT, OREGON-WASHINGTON, AND FOR OTHER PURPOSES.
H.R. Rep. No 884, Comm. on Interior and Insular Affairs, 91st Cong, 2d Sess, March 9, 1970. 9 p.

Descriptors: *Washington, *Multiple-purpose projects, *Irrigation, *Flood protection, *Water allocation(Policy), Legislation, Administration, Construction, Farm use, Water requirements, Government finance, Water supply, Water storage, Reservoir storage, Reservoir operation, Wildlife conservation, Fishing, Recreation, Consumptive use, Streamflow, Adoption of practices, Surface runoff, Water resources development.

A bill to authorize the Secretary of the Interior to construct, operate, and maintain the Touchet Division, Walla Walla Project, with amendments, was reported upon favorably. Funds are appropriated not only for construction costs, but also for the enhancement of the anadromous fishery. The Walla-Walla project in the state of Washington is a multiple-purpose dam and reservoir to provid

ıpplemental irrigation water, a full water supply
other land, and storage regulation sufficient to
ouble its present irrigated acreage. The project
ill also provide for flood control, municipal and
ıdustrial water supply, recreation, and on-site
sh and wildlife development. The Touchet River
alley is limited in agricultural growth potential by
shortage of dependable irrigation water. Present
ater supply for irrigation comes from diversion
unregulated streams. The overdevelopment of
e Touchet River for irrigation has depleted the
ow of the stream seriously. In the summer
onths the runs of anadromous fish have been
estroyed. At other seasons the valley is subject to
ood damage due to a lack of control of runoff
ater. (Sperling-Florida)ll

nces(Pollution).

suit to enjoin a proposed partial fish kill was
d against the Arkansas State Game and Fish
mmission. In reversing the grant of the injunc-
n the Arkansas Supreme Court said the State
me and Fish Commission was not shown to
ve acted arbitrarily, capriciously, or in a wan-
ly injurious manner. The proposed partial fish
l was in a public lake and was opposed by
vners of shore property. A state agency may be
joined if it can be shown that a pending action of
e agency would be beyond the scope of the agen-
's authority. Also an agency can be enjoined if it
about to act in bad faith, arbitrarily, capri-
usly, or in a wantonly injurious manner. It was
ntended that the procedure involved in the fish
l constituted a health hazard and that it sub-
ted them and the public to irreparable damage.

FLOOD DISASTER PROTECTION ACT OF 1973.
Hearings--Subcomm. on Housing and Urban Affairs, Comm. on Banking, Housing and Urban Affairs, U.S. Senate, 93d Cong, 1st Sess, October 31, 1973, 151 p.

Descriptors: *Federal government, *Flood plain insurance, *Flood protection, *Water policy, Flood control, Flood plain zoning, Legislation, Environmental control, Environmental effects, Water management(Applied), Land management, Resource allocation, Conservation.
Identifiers: *Congressional hearings.

This proposed legislation amends portions of the National Flood Insurance Act of 1968. To implement the declared purposes of the 1973 Act, subsequent to stipulated findings, both the Senate and the House versions of this Act provide for the expansion of the flood insurance program. This expansion is accomplished by increasing the coverage limits, increasing the limitations on the coverage outstanding and requiring acquisitions and constructions in flood-prone areas to be insured in order to qualify for federal financial assistance. The House version, further, extends the insurance coverage to losses from erosion and the undermining of shorelines. Both versions include disaster mitigation requirements. HUD's tentative identification of a flood-prone area can be controverted by the community's data. The designated community, in the alternative, may make application to participate in the insurance program. The House version proposes an amendment to the appeal procedure of an aggrieved community. Also included are the statements of witnesses and concerned individuals and organizations. (Hall-Florida)

DIRECTORY OF ENVIRONMENTAL LIFE SCIENTISTS,
Institute of Ecology, Madison, Wis.
Army Corps of Engineers, Washington, D.C., September 1974, 9 volumes, Report EP1105-2-3.

Descriptors: *Scientific personnel, Environment, *Geographical regions, *United States, Classification, *Information exchange, Indexing, Management, Ecosystems, *Professional personnel, Documentation, Evaluation, Foreign countries.
Identifiers: *Environmental impact assessment.

This directory is separately published in 9 volumes for nine regional areas of the U.S., and provides user groups with information about skills and interests of environmental scientists and environment-oriented groups. Each directory is divided into three sections designed to: Locate a scientist within a region of the U.S.; locate a scientist outside of the U.S.; and locate a consulting group anywhere. Separate tables within the first two sections provide an alphabetical listing of respondents (scientists); an index by competence in ecosystem management; an index by research or consultive experience (keywords); an index by impact assessment experience; and an index by scientific field and geographic familiarity. The third section lists environmental consulting groups and associations in alphabetical order. Each directory is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402: Volume 1, North Pacific Region, 603 p, $5.50; Volume 2, South Pacific Region, 726 p, $6.45; Volume 3, Missouri River Region, 525 p, $4.85; Volume 4, Southwest Region, 576 p, $5.30; Volume 5, Northcentral Region, 701 p, $6.25; Volume 6, Lower Mississippi Region, 520 p, $4.85; Volume 7, North Atlantic Region, 698 p, $6.20; Volume 8, Ohio River Valley Region, 664 p, $6.00; and Volume 9, South Atlantic Region, 560 p, $5.15.

ENVIRONMENTAL CONSEQUENCES OF LAND USE IN ARID AND SEMIARID AREAS,
Thessaloniki Univ., Salonika (Greece).
P. A. Gerakis.
Journal of Soil and Water Conservation, Vol 29, No 4, September-October 1974. p 160-164, 3 fig, 22 ref.

Descriptors: *Irrigation, *Land use, *Environmental effects, *Arid lands, *Human population, *Irrigation, Water resources, Planning, Dry farming, Erosion, Ecosystems, Grazing, Africa, Research and Development.

A lack of integrated surveys and local applied research has led to incomplete evaluations of arid and semiarid land resources in developing countries. Types and patterns of land use in these regions are based on water availability for humans, demestic animals, and plants. In addition to following a general strategy of obtaining maximum returns from available resources with a minimum of ecological disturbance, research should be promoted to provide sound environmental impact studies. Experimentation with different land use strategies should be tried, not only to prevent environmental degradation, but to improve ecosystem productivity. This objective cannot be achieved until human population pressures are eased through redistribution or control. (Mastic-Arizona)

An annotated bibliography is presented of reports related to national environmental laws in North American countries. Specifically included are pollution control regulations and experiences in implementing legislative authorities. This collection of summarized documents has been received by the United States Environmental Protection Agency from national environmental agencies of other nations. Regulations provide authority to make rules and conduct inspections relating to environmental improvements. Included are specific legislative acts dealing with sanitary control of drinking water, sewage and waste disposal systems and environmental conditions in regard to housing, commercial, and industrial establishments. Included is legislation, which deals with radiation emissions, atomic energy control, and pesticide use in an effort to maintain atmospheric quality standards. (Proctor-Florida)

This action-oriented citizens' handbook on the present practices of the Army Corps of Engineers includes enabling legislation and congressional guidelines for their work. Pros and cons of their projects (dams, navigation assistance, urban flood control, and regulatory activities) are examined. The handbook's purpose is to guide citizens toward effective participation in water resource planning, with particular regard for the water resource projects of the Army Corps of Engineers. The Corps has shown an increasing interest in citizen participation and environmental issues. Efficiency and professionalism of citizen groups must be raised to approximate the high standards of the Corps. Then citizens can work effectively with the Corps, fostering cooperation where possible. Guidelines for citizen group organization and techniques are explained, stressing the political nature of their activity. The mandated 18 steps followed in all large Corps projects from initial planning through completed construction are examined for appropriate timing and method of citizen input. The best stage is clearly the first 6 steps, the planning and hypothesis stage, but even after-step 12 (Congressional Authorization of Project Construction) alternative economic analysis based on sound benefit-cost calculations will be considered. Information on how to do benefit-cost analysis, environmental surveys, and discount rate computation is included, as well as analyses of court decisions and 3 case studies showing citizen participation at various steps. Throughout, the emphasis is on thorough, patient, well-informed citizen action. (Herr-North Carolina)

tifiers: *India(Bhatghar River-Koyna River).

ose network of adequate number of raingages ibuted uniformly over the catchment area rally helps in obtaining the estimate of nment mean rainfall with the desired degree of ision. Raingall amounts gaged over the exist- number of raingage stations situated in two catchments, Bhatghar and Koyna, were yzed. Bhatghar catchment has an east-west ad and a certain trend in the rainfall while na has a north-south spread and a good deal of tion but no trend in the rainfall. The optimum ber of raingages required for these two nments for estimating mean monthly or nal rainfall with a desired degree of accuracy confidence levels was calculated and com- d. Methods of allocation of additional ra- es required for the two catchments were con- ed separately on the basis of their peculiar raphic characteristics. (See also W75-01961) s-ISWS)

Distribution of Precipitation In Mountainous s, Volume II; Proceedings of the Geilo Sym- m, Geilo, Norway, July 31-August 5, 1972. d Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 432-447, 1973. 6 fig, 3 tab, 4 ref.

Descriptors: *Network design, *Statistics, *Precipitation(Atmospheric), *Time series analysis, Frequency analysis, Rainfall, Watersheds(Basins), Mountains, Storms, Maryland, Idaho, Vermont, Virginia, Hydrology.

Areal variation of precipitation in mountainous areas is a common attribute of observational data. Basic to all investigations that require precipitation information is the development of measures of this variation. Cross spectra determined from series of precipitation data at pairs of nearby stations with differing exposures in mountainous areas were used to examine the variability. The time series consisted of both daily data and short-duration increments from individual major storms from locations in Maryland, Idaho, Vermont, and Virginia. The statistics provided a measure of the persistence and uniformity of the precipitation between the gages, and hence, an indication of the spatial and temporal resolution required for the establishment of an adequate network. The techniques applied to the data were particularly useful in the development of models for predictive purposes in watershed hydrology. The most immediate application is for network design because it provides a measure of the uniformity and persistence of precipitation in time over short distances, and therefore, is an indication of the spatial and temporal resolution required to describe the precipitation characteristics. ISOTOPIC AND CHEMICAL CONSIDERATIONS IN RADIOCARBON DATING OF GROUNDWATER WITHIN THE ARID TUCSON BASIN, ARIZONA,
Arizona Univ., Tucson. Dept. of Geosciences.
E. I. Wallick.
PhD Dissertation, 1973. 184 p, 15 fig, 19 tab, 80 ref, append.

Descriptors: *Groundwater basins, *Radioactive dating, *Arizona, *Chemical analysis, *Model studies, *Computer models, Carbon calcite, Carbon radioisotopes, Aquifers, *Chemical properties, Calcium carbonate, Carbon dioxide, Well data, Wells.
Identifiers: Tucson Basin.

A chemical-isotopic equilibrium model was developed for adjustment of radiocarbon ages of groundwater from the arid Tucson basin for dilution of the initial groundwater C-14 activity by the solution of soil calcite having a C-14 of 25 plus or minus, 19% modern. Input to the model consisted of the laboratory chemical analyses for Ca ++, Mg ++, Na+, K+, H4SiO4, SO4=, HCO3-, CO3=, NO3-, and pH, and delta C-13 for the total dissolved carbon in the groundwater. Output consisted of the equilibrium chemical composition of the groundwater, the ratio of soil CO2 derived to total dissolved carbon, Q, and delta C-13 of total dissolved carbon, H2CO3, HCO3-, and CO3= and delta C-13 for the soil CO2 and calcite that initially dissolved in the surface water as it equilibrated with soil minerals. Radiocarbon age of the groundwater is computed from the equation T = 8270 In ((Q + (1-Q) ACaCO3)/Am) where T is the age in years before A.D. 1950, ACaCO3 is the soil calcite activity and Am is the measured activity for the dissolved carbonate in the groundwater, both with respect to modern wood. The validity of the model was tested by comparing the predicted values for delta C-13 (CO2), delta C-13 (CaCO3) with measured values for samples from the Tucson basin. On the basis of these results, the model adequately describes the natural system and may prove useful in future radiocarbon dating work in desert regions.

IMPROVED INSTRUMENTATION FOR MEASURING MELTED PRECIPITATION ON WIND-SWEPT TOPOGRAPHY,
Forest Service (USDA), Moscow, Idaho. Intermountain Forest and Range Experiment Station.
H. F. Haupt.
In: Distribution of Precipitation in Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 73-85, 1973. 3 fig, 4 tab, 14 ref.

Descriptors: *Snowmelt, *Mountains, *Lysimeters, Snow, Rain gages, Mountain forests, Snowpack, Water equivalent, Winds, *Idaho, Precipitation(Atmospheric), *Instrumentation, Measurement.
Identifiers: Windshields, Priest River(Utah), Selkirk Mountain Range(Utah).

The winter performances of three instruments: (1) a standard weighing gage with horizontal orifice and windshield, (2) a similar gage with modified (stereo) orifice and tilted windshield parallel to the slope inclination, and (3) a dual-purpose net precipitation-snowmelt lysimeter--were compared in openings and coniferous forest on the windward and lee side of a mountain ridge in northwestern United States. Mounted on towers in windswept openings, the standard gage-horizontal shield and modified gage-tilted shield were less efficient than the ground-level lysimeter by 49% and 24%, respectively. The lysimeter proved most superior in measuring total seasonal (melted) precipitation. Furthermore, in the windswept forest the lysimeter outperformed the standard and modified gages, but the modified gages were nearly alike in total catch. On the lee side, protected in part from the full blast of wind, the lysimeter was only 7 to 8% more efficient than the mounted gages. (See also W75-01961) (Jones-ISWS)

PRECIPITATION MEASUREMENTS BY MEANS OF STORAGE GAUGES WITH STEREO AND HORIZONTAL ORIFICES IN THE BAYE DE MONTREUX WATERSHED,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
B. Sevruk.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 86-95, 1973. 4 fig, 3 tab, 35 ref.

Descriptors: *Rain gages, *Mountains, Orifices, Precipitation(Atmospheric), Slopes, Winds, Snowfall, Topography, Instrumentation, Measurement.
Identifiers: *Stereo gages, *Storage gages, Ridges, Mougin storage gas, Nipher-Billwiller windshields, *Switzerland(Baye de Montreux).

On the steep, open slopes in the proximity of the ridges which are exposed to the rain-bearing westerly winds, the stereo orifices yielded precipitation figures about twice as high as those collected by horizontal orifices. At half the height of the slope in the wooded zone and in sheltered locations, the stereo orifices yielded only a small increase or none at all. The increase of precipitation with altitude was more clearly evidenced in the values of the instruments with orifice surfaces parallel to the slope than in those with horizontal orifices. The results obtained with measurements over a period of 19 years show that stereo orifices are better suited than horizontal orifices for meeting the requirements of precipitation measurements on steep, open slopes exposed to rain-bearing winds. EVAPORATION LOSSES FROM STORAGE GAUGES,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
B. Sevruk.
In: Distribution of Precipitation In Mountainous Areas, Vol. II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 96-102, 1973. 4 fig, 3 tab, 20 ref.

Descriptors: *Raingages, *Evaporation, Snow, Solar radiation, Air temperature, Seasonal, Statistical methods, Regression analysis, Saturation.
Identifiers: *Storage gages, Wind shields, Mougin gage.

In many countries responsible meteorological services accept an oil layer 2 to 3 millimeters thick for the prevention of evaporation errors in precipitation measurements with storage gages. The results of the investigations described showed that an oil layer of this thickness cannot prevent evaporation from the storage gages and, particularly in summer, the layer may be a further source of errors in precipitation measurements with storage gages. This was also demonstrated by an example from a test area near Lake Geneva where over a period of ten years a storage gage with a 2-mm oil layer recorded an average of about 6% less precipitation in summer than the daily measurements with a standard precipitation gage. W75-04657

ANALYSIS OF SNOW COVER DISTRIBUTION FROM AEROPHOTOGRAPHY DATA OVER EXPERIMENTAL MOUNTAIN BASIN OF VARZOB RIVER,
Hydrometeorological Service of the USSR, Moscow.
T. S. Abaljan.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 103-110, 1973. 3 fig, 4 tab, 7 ref.

Descriptors: *Precipitation(Atmospheric), *Snow cover, Water resources, Hydrology, Aerial photography, Snowmelt, Avalanches, Slopes, Snow surveys, Distribution patterns.
Identifiers: *USSR(Varzob River Basin).

The Varzob River Basin was photographed from the air from 7-9 times within each snow melting period of the years 1964-1967. These photographs were used to calculate the snow-covered area at 400 m height intervals. The photographs were also used to determine the change in snow cover as the cover melted and a relationship was established between the snow cover melt and the positive mean daily air temperature. The time interval for the calculation was for 5 days and interpolation was required for these intermediate intervals since photographs were not taken this often. The effects on the distribution of snow by avalanches was noted. (See also W75-01961) (Jones-ISWS)

W. Attmannspacher.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 544-551, 1973. 6 fig, 1 tab, 2 ref.

Descriptors: *Radar, *Rainfall, *Remote sensing, Rain gages, Measurement, Networks, Mountains, Meteorology, Precipitation(Atmospheric), Statistics.
Identifiers: *Germany(Hohenpeissenberg Mt).

At the isolated mountain peak Hohenpeissenberg measurements of precipitation over an area by aid of an X-band radar were started in 1969. The method of this research and the requirement on the radar equipment were discussed. The results show that the method of measuring areal precipitation by radar is useful, but the attenuation of the radar beam caused by precipitation is too strong for the 3.2 cm wave length; thus, only special cases can be measured exactly. A LEAK-PROOF SAMPLING PORT IN GAS ANALYSES STUDIES,
Guelph Univ., (Ontario). Dept. of Land Resource Science.
A. E. Smid, and E. G. Beauchamp.
Soil Science Society of America Proceedings, Vol 38, No 6, p 983-984, November-December 1974. 2 fig, 9 ref.

Descriptors: *Sampling, *Gases, Microbial degradation, Soil gases, Analytical techniques, Nitrogen, *Gas chromatography.
Identifiers: *Serum caps, Septum.

Unmodified rubber serum caps frequently used as sampling ports in gas analysis studies failed to reseal after being punctured. Mean N2 leakage through puncture holes increased from 92 to 5200 microliters/liter after 24 hours with one puncture and to 12,000 microliters/liter after an additional 24 hours with two puncture holes. Leak-proof serum caps were devised by sealing silicone rubber septa into them with silicone rubber sealant. (Visocky-ISWS)

AREAL RAINFALL ANALYSIS BY COMPUTER,
British Meteorological Office, Bracknell (England).
P. M. Salter.
In: Distribution of Precipitation In Mountainous Areas, Volume II; Proceedings of the Geilo Symposium, Geilo, Norway, July 31-August 5, 1972. World Meteorological Organization Publication No. 326 (2 Vol.), Geneva, Switzerland, p 497-509, 1973. 4 fig, 5 tab, 8 ref.

Descriptors: *Rainfall, *Data storage and retrieval, *Mapping, Isohyets, Contours, *Computer programs, Data processing, *Areal hydrogeology.
Identifiers: United Kingdom.

The plotting and drawing of isohyetal charts by hand is laborious. The ever-increasing amount of past rainfall data now available in computer-compatible form invites use of the computer to do this work. The method adopted for use for any required area in the United Kingdom is based on a 5-km grid. Rainfall values for the grid points are obtained by interpolation from the irregular station network; an allowance is made for the effects of topography by use of a background field of average annual rainfall. Having obtained grid-point values for this relatively dense and regular network, areal rainfalls over irregular areas may be calculated simply by averaging values within the area. Computer prepared isohyetal charts are sufficiently accurate for many purposes and areal rainfalls for areas of 200 sq km or more can be ob-

tained for most parts of the country. The minimum area may not be as low for an area with a sparse station network. (See also W75-01961) (Sims-ISWS)

Descriptors: *Data processing, *Analytical techniques, *Precipitation(Atmospheric), *Areal, Computer programs, Average, Rainfall, Isohyets, Graphical analysis, Numerical analysis, Floods.
Identifiers: Interpolation methods, Thiessen polygons, Germany.

In accordance with the well-known graphical-numerical methods of the computation of areal precipitation, computerized methods were developed and the feasibility of their application was investigated. The accuracy of the results from the computation of areal precipitation of annual and daily amounts of rainfall was compared with the traditionally applied method. The investigations were carried out on a watershed in northwestern Germany with an area of about 4400 sq km and a maximum network density of rain gaging stations of about 2.0 stations per 100 sq km. The developed procedures were briefly described and the results obtained by a large statistical evaluation were discussed. (See also W75-01961) (Sims-ISWS)

Descriptors: *Data processing, *Rainfall, *Precipitation(Atmospheric), Average, *Estimating, Model studies, *Areal, Computer models.
Identifiers: *Trend surface fitting, Polynomial surfaces, Double Fourier surfaces.

Some of the most promising fully automated methods of estimating mean areal rainfall involve the fitting of rainfall surfaces to the data points by least-square techniques. Polynomial surfaces (trend surfaces) were compared with double Fourier series surfaces in terms of their goodness of fit to the observed data and the effects of including altitude as a further variable were examined. Methods of simplifying these techniques for practical use were discussed. (See also W75-01961) (Sims-ISWS)

W75-04729

AUTOMATED SYSTEM FOR MEASUREMENT, COLLECTION AND PROCESSING OF HYDROMETEOROLOGICAL DATA ABOARD SCIENTIFIC RESEARCH VESSELS OF THE GUGMS (SIGMA-S),
Ye. P. Borisenkov, and O. M. Fedorov.
NASA TT F-801, p 1-18, November 1974, 2 fig, 12 ref.

Descriptors: *Research facilities, *Instrumentation, *Data processing, *Oceanography, Meteorology, Automation, Research equipment, Ships, Foreign research, Hydrography.
Identifiers: Scientific research vessels.

The automated system known as SIGMA-s for the measurement, collection, and processing of hydrometeorological data aboard scientific research vessels of the Hydrometeorological Service was discussed. The various components of the system and the interfacing between them were described, as well as the projects that the system is equipped to handle. (See also W75-04729) (Sims-ISWS)
W75-04730

SOFTWARE FOR THE SIGMA-S,
I. A. Dyubkin.
In: NASA TT F-801, p 19-33, November 1974. 2 fig, 18 ref.

Descriptors: *Data processing, *Computer programs, *Oceanography, *Meteorology, Automation, Algorithms, Computers, Mathematics.
Identifiers: Interpolation.

The software needed for the SIGMA-s was described. Various mathematical procedures, such as introducing corrections and parameters, interpolating for depth and altitude, isolating special points and layers in the distribution of hydrometeorological elements, smoothing of signals from sensors, critical analysis of and setting up the results in graphs and tables, coding of the data into information carriers, and recording of the data, were presented. (See also W75-04729) (Sims-ISWS)
W75-04731

THE PROBLEM OF ORGANIZATION OF A COASTAL COORDINATING COMPUTER CENTER,
I. A. Dyubkin, and I. I. Lodkin.
In: NASA TT F-801, p 34-48, November 1974. 4 fig, 11 ref.

Descriptors: *Data storage and retrieval, *Data processing, *Management, Meteorology, Oceanography, Computers, Coordination.

Fundamental principles were provided of the operation of a coastal coordinating and computing center under conditions of automation. Special attention was devoted to the work of Coastal Computer Center of the Arctic and Antarctic Scientific Research Institute. This center generalizes from data collected in expeditions and also from observations made at polar stations. (See also W75-04729) (Sims-ISWS)
W75-04732

A SYSTEM OF AUTOMATED PROCESSING OF DEEP WATER HYDROLOGICAL INFORMATION,
V. A. Romantsov, I. A. Dyubkin, and L. N. Klyukbin.
In: NASA TT F-801, p 49-70, November 1974. 1 fig, 2 tab, 23 ref.

Descriptors: *Data processing, *Oceanography, Computers, Automation, Computer programs, Water chemistry.

An automated system for primary and scientific analysis of deep water hydrological information was presented. Primary processing of the data in this system is carried out on a drifting station which also calculates the parameters of vertical stability of the sea layers, as well as their depths and altitudes. Methods of processing the raw data were described. (See also W75-04729) (Sims-ISWS)

SMALL PARAMETRIC MODEL OF THE PRECOMPUTATION OF METEOROLOGICAL FIELDS ON THE BASIS OF COMPLETE EQUATIONS AND ITS ENERGETIC ANALOGS,
Ye. P. Borisenkov.
In: NASA TT F-801, p 85-111, November 1974. 1 ref.

Descriptors: *Mathematical model, *Meteorology, Equations, Wind velocity, Thermodynamics, Oceans, Parametric hydrology, Energy, Hydrodynamics.

A small parametric, nonadiabatic model for precomputation of meteorological fields on the basis of complete equations, along with its energetic analogs, was described. The model incorporates integral characteristics of the components of the wind speed and the analogous functions of the total fluxes of the ocean, and uses a Cartesian isobaric system of coordinates. (See also W75-04729) (Sims-ISWS)
W75-04736

ESTIMATE OF HEAT FLUXES ON THE SUBJACENT SURFACE (ACCORDING TO DATA FROM SYNOPTIC ANALYSIS),
A. P. Nagurnyy.
In: NASA TT F-801, p 112-120, November 1974. 2 fig, 6 ref.

Descriptors: *Mathematical models, *Heat flow, Model studies, *Meteorology, *Heat transfer, Data processing, Air circulation, *Synoptic analysis, Convection, Temperature.

Several methods of estimating heat fluxes from nonadiabatic sources distributed over a subjacent surface were discussed. Data calculated by synoptic analysis for the entire northern hemisphere from aerological soundings at the 500 and 400 absolute temperature levels, along with the temperature of the subjacent surfaces, were used. A polytropic model of the atmosphere was used in order to avoid the problems posed by the lack of any complete theory of heat transfer in the lower atmosphere. (See also W75-04729) (Sims-ISWS)

FLOATING WAVE BARRIER,
W. W. Bowley.
U.S. Patent No 3,848,419, 5 p, 7 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 928, No 3, p 942, November 19, 1974.

Descriptors: *Shore protection, *Patents, *Barriers, *Waves(Water), Beaches, Ocean waves, Floats.
Identifiers: *Wave action, *Wave energy, *Kinetic energy, Floating barriers.

A floating wave barrier is comprised of at least one vessel having a top, walls and an open bottom which, when placed in water, has the open bottom submerged. The vessel has at least one plate attached to the outside surface of the vessel and extending around all or a major portion of the vessel periphery. The vessel or vessels, when placed in water, contain a gas and water. When placed in water, the vessels and plate members are fixed to prevent substantial movement in the horizontal direction but are free to move in a vertical direction within the wave with the vertical movement of the connected vessels and plate members being out of phase with each other. The wave barrier dampens the vertical velocity component of waves by generating reflected waves in a seaward direction to impinge upon incoming waves and by displacing water from a wave at its crest to an adjacent wave trough. A number of these barriers are arranged parallel to the shore being protected at varying distances from the shore so that a given portion of the wave contacts more than one barrier prior to reaching the shore. (Sinha-OEIS)
W75-04453

INFLATABLE BARRIERS FOR WATERCOURSES,
Pneumatiques, Caoutchouc Manufacture et Plastiques Kleber-Colombes (France). (assignee)
J. V. Ganzinotti.
U.S. Patent No 3,855,800, 4 p, 9 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1419, December 24, 1974.

Descriptors: *Patents, *Erosion control, *Barriers, Rivers, Inland waterways.
Identifiers: *Inflatable barriers, *Watercourses.

An inflatable barrier is used for retaining water in a watercourse. It comprises at least one inflatable enclosure secured to an element anchored directly or indirectly in such watercourse and constructed in such a fashion as to prevent erosion. Means are provided for anchoring the enclosure in relation to the watercourse bed, and this means incorporates an anchoring strip of supple material such as rubber that is securable to the bed. This strip has a free extremity or edge porvided with one or more means for removably connecting the barrier to the strip. The anchoring strip may be secured to a rigid member arranged to be laid down in the soil of the bed of the watercourse and this rigid member may take the form of a block of masonry. Alternatively, the anchoring strip may be embedded in the soil of the bed of the watercourse by digging out a

transverse trench using the removed aggregates to form a temporary dam, laying the anchoring strip in the trench preferably at an angle of 45 deg to the plane of the bed, and then filling up the trench with the aggregates previously dug out, thus to secure the strip in relation to the soil of the bed. (Sinha-OEIS)

DEVELOPMENT OF GUIDELINES FOR THE DESIGN OF SUBSURFACE DRAINAGE SYSTEMS FOR HIGHWAY PAVEMENT STRUCTURAL SECTIONS,
Cedergren/KOA, Long Beach, Calif.
H. R. Cedergren, J. A. Arman, and K. H. O'Brien.
Available from the National Technical Information Service Springfield, Va. 22161 as PB-231 173; $7.25 paper copy, $2.25 microfiche. Report No FHWA-RD-73-14, February 1973. 193 p, 27 fig, 6 tab, 23 ref. FH-11-7582.

Descriptors: *Drainage, *Highways, *Design, *Subsurface drainage, Drainage systems, Outlets, Pipes, Paving, Hydrology, Drainage effects, Subsurface waters, Surface waters, Subsurface drains, Drainage engineering, Analytical techniques, Cost-benefit analysis, Maintenance.
Identifiers: Collector drains, Open graded bases, Drainage layers.

Results were presented of interviews with State highway department personnel, field reconnaissance of pavements in 9 states, and 9 case studies of selected pavements in the Federal Highway Administration Regions. Problems with existing drainage design concepts and construction methods were pointed out, showing why many pavements are saturated with water for long periods of time each year. It was deduced that this saturation contributes to considerable shortening of pavement life. A new method of design was presented to take care of the infiltration of surface water. Inflow-outflow analyses and highway geometrics were included in a procedure utilizing a two-layer graded filter to rapidly remove any water entering the structural layers. 8B. Hydraulics

AN EXPERIMENTAL STUDY OF THE FREE SURFACE EFFECT ON A BUOYANT JET,
General Dynamics Corp., Groton, Conn. Electric Boat Div.
B. S. Ryskiewich, and L. Hafetz.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 536, $5.25 in paper copy, $2.25 in microfiche. Report No U440-74-103, p 119, January 1975. 68 fig, 4 tab, 5 ref. OWRT C-4276(No 9045)(1).

Descriptors: *Thermal pollution, *Jets, *Buoyancy, *Turbulence, *Free surfaces, Powerplants, Temperature, Submergence, Design data, Path of pollutants.

The effect of the surface on a submerged, round, turbulent, buoyant jet has been investigated experimentally. The results show that the surface retards temperature reduction leaving the maximum surface temperature at a higher level than would normally occur from an unbounded jet. The effect is particularly apparent for horizontal jets and decreases as the jet angle increases. Jet discharge variables were taken over a broad range; namely, Froude number from 2 to 60.1, discharge angle from 0 deg to 90 deg, and submergence depth from 10 to 80 jet diameters. The discharge variables range covers most cases of practical interest and the results, presented in graphical form, provide valuable data which will enable a power plant diffuser designer to execute his design with confidence in the plume behavior and surface effect. The data will also be useful to the marine biologist and others concerned with the buoyant jet's ecological implications.

BIFURCATION CHARACTERISTIC REYNOLDS NUMBER,
Alberta Univ., Edmonton.
C. M. Rodkiewicz.
Journal of Hydraulic Research, Vol 12, No 2, p 241-252, 1974. 9 fig, 1 tab, 3 ref.

Descriptors: *Flow separation, *Pipelines, *Pipe flow, *Reynolds number, *Laboratory tests, Networks, Hydraulic systems.
Identifiers: *Bifurcation flow systems, Noises, Blood flow phenomenon, Arterial junctions, Hydrogen bubble technique.

The experimental studies of the flow characteristics in the bifurcation, where a single cylindrical branch leaves the parent trunk, were presented. The range of the entrance Reynolds number varied from 2000 to 11,000. For most bifurcations, around entrance Reynolds number of 7000, an unusual drop in the ratio of the mass flow rate in the side branch to the flow rate in the main branch, R, takes place. This drop was followed by a peculiar local recovery in the R ratio, which may be linked to a change in pressure and consequently may be a contributing factor in the generation of noises within the variable flow piping hydraulic systems. (Bhowmik-ISWS)
W75-04715

CHANNEL FLOW DRIVEN BY A STATIONARY THERMAL SOURCE,
Massachusetts Inst. of Tech., Cambridge.
D. A. Salstein.
Tellus, Vol 26, No 6, p 638-651, 1974. 8 fig, 1 tab, 10 ref. NSF Grant GA-36021X.

Descriptors: Analysis, *Fluid mechanics, *Heat flow, *Channel flow, *Average flow, Momentum equation, Continuity equation, Energy equation, Velocity, Equations, Analytical techniques, Topography, Mathematical studies, Distribution, Reynolds number, Thermal pollution.
Identifiers: *Boundary conditions, *Rayleigh number, Periodic channel, Reynolds stress, Prandtl number, Grashof number, Perturbation technique.

Analytical methods were used to show that mean horizontal flow may be produced from a periodic distribution of stationary heat sources which are placed on a varying topographic surface. Past analyses and experiments of channel flows were reviewed. Conditions necessary for the production of mean horizontal flows were derived for several boundary conditions on the upper fluid surface. The heat balance, momentum flux, and velocity field of this fluid system were discussed for these boundary conditions. (Adams-ISWS)
W75-04793

AN ALTERNATIVE FORMULATION OF THE PROBLEM OF DENSITY JUMP,
Sargent and Lundy, Chicago, Ill.
S. C. Mehrotra.
Tellus, Vol 26, No 5, p 579-581, 1974. 1 fig, 2 ref. NSF Grant GA-31247.

Descriptors: Density, *Continuity equation, *Momentum equation, *Density currents, Froude number, Weirs, Analysis, Entrainment, Depth, Critical flow, *Hydraulic jump, Equations.
Identifiers: *Density jump, Differential equations.

An alternative formulation of the density jump problem was presented. The formulation was not restricted by the Boussinesq assumption and was thus more general than the original formulation of Wilkinson and Wood. A first order ordinary differential equation was obtained for the crest height of a controlling weir as a function of the depth of the flowing layer downstream of the transition. A boundary condition corresponding to the immiscible jump was applied. A closed form solution of the differential equation was found to be possible but an explicit expression of the solution was not presented. (Adams-ISWS)
W75-04797

SIMPLIFIED APPLICATION OF PALMER-BOWLUS FLOW METERS,
ENCIBRA South America, Sao Paulo (Brazil).
R. G. Ludwig, and J. D. Parkhurst.
Journal Water Pollution Control Federation, Vol 46, No 12, p 2764-2769, December 1974. 3 fig, 8 ref.

Descriptors: *Discharge coefficient, *Rating curves, *Flow measurement, *Open channel flow, Measurement, Calibrations, Critical flow, Conduits, Discharge(Water), Flumes, Instrumentation.
Identifiers: *Critical depth meters, *Palmer-Bowlus flumes.

Simplified procedures for determining the rating curves for Palmer-Bowlus type flumes were presented. Rating tables were given for two standardized trapezoidal throat Palmer-Bowlus flumes for use in circular conduits flowing partially full. Discharge coefficients for use in a simple rating equation were shown graphically for rectangular throat flumes in circular and rectangular conduits. (Adams-ISWS)

SPECIAL METHODS OPEN STORM-BLOCKED PIPELINE.
Water and Sewage Works, Vol 121, No 8, p 60-61, August, 1974.

Descriptors: *Pipelines, *Sewage treatment, Equipment, Costs, Storm sewers, Pumping, Waste disposal, Treatment facilities, *Waste water treatment.
Identifiers: Pipe cleaning.

New techniques for cleaning storm-blocked sewer pipes were developed and implemented by the Robinson Pipe Cleaning Company, Canonsburg, Pennsylvania. Several miles of 42-inch main interceptor sewer line were disabled, in an area from Western Baltimore suburbs to their sewage treatment plant, as a consequence of Tropical Storm Agnes. After damage to the line was repaired, a five-mile portion had to be cleaned, unseen debris removed, and hidden defects located. Specialized small equipment was used, including high-pressure jets, bucket pullout machines, augers, and trash pumps. Water was pumped through jet-equipped trucks at pressures of 1500 psi to break up bulk material. Trash pumps disposed of the slurry created. Heavier objects were handpicked from the line. Brick and brick-sized stone were bucketed through the line and removed through manholes. After final jetting and pumping to flush the material, the pipes were checked visually, using miner's helmet lights and torches. The line was then functionally operative. These methods saved costs and time ranging up to 90 percent of those of replacing the pipe system. (Prague-FIRL)

2D. Soil Mechanics

STRESS-STRAIN RESPONSE FOR SAND,
Punjab Agricultural Univ., Ludhiana (India).
A. Basak, and S. P. Brahma.
Soil Science, Vol 118, No 6, p 358-364, December 1974. 8 fig, 6 ref.

Descriptors: *Sands, *Stress, *Strain, *Soil physical properties, Soil strength, Cohesionless soils, Shear strength, Poisson ratio, Hysteresis, Void ratio, Soil properties, Soil engineering, Laboratory tests.
Identifiers: Kalpi sand.

A three-parameter stress-strain equation was proposed and compared with the experimental stress-strain response of a uniform, subrounded sand. The fitting was found to be excellent up to the failure. With the help of relevant boundary conditions, the constants a, b, and n were expressed as a function of shear strength, initial tangent modulus, and failure strain. Experimental correlation was made between initial void ratio and normal stress with the parameters a, b, and n. (Anderson-ISWS)

FRESHWATER JELLYFISH (CRASPEDACUSTA SOWERBYI) IN LAKE PATAGONIA, SOUTHERN ARIZONA,
Arizona Cooperative Fishery Unit, Tucson.
B. E. Kynard, and J. C. Tash.
Arizona Academy of Science, Journal, Vol 9, No 2, p 76-77, June 1974. 1 fig, 13 ref.

Descriptors: *Jelly fish, *Arizona, *Fish stocking, *Artificial lakes, Fish, Fisheries, Zooplankton.
Identifiers: Lake Patagonia(Ariz.).

Freshwater jellyfish were discovered in Lake Patagonia during September 1973, the first report of their presence in Arizona. The species was probably introduced into the lake with stocked fish. Feeding studies indicate that the medusae compete directly with young fish for zooplankton and could have a deleterious effect on the fisheries of the lake. Sixty-five medusae were collected at three sites in the lake, and measured. No search was made for polyps. (Mastic-Arizona)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 686, $4.75 in paper copy, $2.25 in microfiche. 1974. 79 p, 1 fig, 10 tab. OWRT A-999-MD(10).

Descriptors: *Water Resources Research Act, *Maryland, *Water Resources Institute, *Universities, Training, Grants, Projects, Water pollution, Water quality, Estuaries, Waste disposal, Waste water disposal, Waste water treatment, Farm wastes.

Research and other activities underway at the Maryland Water Resources Research Center during Fiscal Year 1974 (July 1, 1973 - June 30, 1974) are described, and current and anticipated water problems are identified. Competitive multiple uses of water continue to generate the major water resource problems. The Research Center's largest project pertains to the potential impact on soils, crops, and other vegetation of emissions of a large, natural draft, cooling tower that uses brackish water. Other problem areas being studied include treatment and disposal of farm wastes, urban storm runoff, chlorinated sewage effluents, heavy metals and minerals in Chesapeake Bay sediments, water pollution effects on aquatic life, and contributions of tidal marshlands to food chains in estuaries. CARBON ADSORPTION METHOD
Organic Compounds Entering Ground Water from a Landfill,
W75-04573 5B

CARBON DIOXIDE
Changes in Transpiration, Net Carbon Dioxide Assimilation and Leaf Water Potential Resulting from Application of Hydrostatic Pressure to Roots of Intact Pepper Plants,
W75-04399 3F

CARBON RADIOISOTOPES
Radiocarbon, Carbon-13 and Tritium in Water Samples from Basaltic Aquifers and Carbonate Aquifers on the Island of Oahu, Hawaii,
W75-04441 2F

CARBON TETRACHLORIDE EXTRACTION
Measurement of Hydrocarbons in Water: Application to Cases of Surface Water Pollution,
W75-04709 5A

CARBONATE AQUIFERS
Radiocarbon, Carbon-13 and Tritium in Water Samples from Basaltic Aquifers and Carbonate Aquifers on the Island of Oahu, Hawaii,
W75-04441 2F

CARBONATE ROCKS
Controls on the Quality Variations of Some Carbonate Spring Waters,
W75-04710 2F

CARIBBEAN SEA
Production Ecology of Two Caribean Marine Ecosystems: I. Physical Environment and Fauna,
W75-04479 5C

CATIONS
Deposition of Water and Cations on Artificial Foliar Collectors in Fir Krummholz of New England Mountains,
W75-04471 2K

CATTLE
Fast Fluch System,
W75-04622 5D

Dewatering Bovine Animal Manure,
W75-04627 5D

EPA Preparing to 'Railroad' Through New Pollution Rules Covering Cattle Feedlots,
W75-04639 5G

Effects of Cattle Feedlot Manure on Crop Yields and Soil Conditions,
W75-04833 5D

Water Quality of Storm Runoff from a Texas Beef Feedlot,
W75-04843 5B

CEDAR BAYOU (TEX)
Flood Plain Information - Cedar Bayou, Houston Metropolitan Area, Texas.
W75-04748 4A

CENTRIFUGATION
Trace Metals in Wastewater Effluents,
W75-04806 5B

CESIUM-137
The Effect of Salinity and Ionic Equilibrium on Contamination of Arenicola Marina L. (Annelida: Polychaeta) by Cesium-137, (In French),
W75-04489 5C

CESSPOOLS
Subsurface Sewage Disposal and Contamination of Ground Water in East Portland, Oregon,
W75-04798 5B

CHANNEL FLOW
Channel Flow Driven by a Stationary Thermal Source,
W75-04793 8B

CHANNEL MORPHOLOGY
River Regime With Special Reference to River Nile,
W75-04706 2E

CHEMICAL ANALYSIS
Identification and Evaluation of Water Tracers Amenable to Post-Sampling Neutron Activation Analysis,
W75-04355 5A

Isotopic and Chemical Considerations in Radiocarbon Dating of Groundwater Within the Arid Tucson Basin, Arizona,
W75-04647 7B

CHEMICAL AVOIDANCE
The Effect of Temperature and Chemical Pollutants on the Behavior of Several Esturine Organisms,
W75-04353 5C

CHEMICAL OXYGEN DEMAND
A Study of the Waste Wash Water from Egg Washing Machines,
W75-04475 5B

CHEMICAL PROPERTIES
Isotopic and Chemical Considerations in Radiocarbon Dating of Groundwater Within the Arid Tucson Basin, Arizona,
W75-04647 7B

CHEMICAL TREATMENT
Water Clarification with Nitrogen-Heterocyclic Phosphonic Acids,
W75-04457 5D

Removal of Boron From Water,
W75-04462 5D

CHEMICAL WASTES
Laboratory Study of Continuous Electrooxidation of Dilute Cyanide Wastes,
W75-04719 5D

CHEMICALS
Chemicals and Allied Products, (Literature Review),
W75-04474 5G

Computer Control of Chemical Addition at a Water-Treatment Plant,
W75-04535 5F

CHESAPEAKE (VA)
Flood Plain Information--Coastal Flooding, City of Chesapeake, Virginia.
W75-04753 4A

CHETOLAH CREEK (KAN)
Flood Plain Information: Big Creek, Chetolah Creek and Lincoln Draw, Hays, Kansas.
W75-04749 4A

CHIRONOMID PUPAL EXUVIAE
The Use of Chironomid Pupal Exuviae for Characterizing Streams,
W75-04371 5B

CHLORINATION
Electrochemical Process for Nutrient Removal,
W75-04446 5D

Method for Electrosanitizing Waste Water,
W75-04464 5D

CHLORINE
The Effect of Temperature and Chemical Pollutants on the Behavior of Several Esturine Organisms,
W75-04353 5C

CIRCULATION
Rainfall Patterns and General Atmospheric Circulation,
W75-04513 2B

CIRCULATORY SYSTEM
Recipient Radiation Exposure - Circulatory Support Systems,
W75-04419 5C

CITIZEN PARTICIPATION IN WATER RESOURCE PLANNING
Engineering a Victory for the Environment: A Citizen's Guide to the U.S. Army Corps of Engineers,
W75-04755 6G

CITY PLANNING
Regulation of Urban Development to Control Runoff and Erosion,
W75-04362 4D

Investigation of Land Use of Northern Megalopolis Using ERTS-1 Imagery,
W75-04726 7C

The Urban Region Plan: Saint John, (New Brunswick), Urban Region Impact Study.
W75-04756 6B

CLAMS
Petroleum Hydrocarbons in Narragansett Bay: I. Survey of Hydrocarbons in Sediments and Clams (Mercenaria Mercenaria),
W75-04477 5B

CLEAR CREEK (TEX)
Special Flood Hazard Information: Clear Creek, Brazoria, Fort Bend, Galveston and Harris Counties, Texas.
W75-04743 4A

CLIMATES
Effect of Feedlot Laws and Climate on Open Feedlot Waste Management,
W75-04630 5D

CLIMATIC DATA
Rainfall Patterns and General Atmospheric Circulation,
W75-04513 2B

CLIMATOLOGY
Statistical Considerations About Snow Conditions in the Austrian Alps,
W75-04667 2C

CLINICAL DIAGNOSIS
Medical Uses of Isotopes,
W75-04417 5C

CLOUD COVER
The Problem of Calculating Cloud Cover in Calculations of Long Wave Radiational Characteristics of the Atmosphere,
W75-04740 2B

CLOUD PHYSICS
Diurnal Variations in Cloud Condensation Nuclei,
W75-04711 2B

Atmospheric Moisture Parameterization,
W75-04724 2B

CLOUD SEEDING
Atmospheric Water Resources Management Program - Bridger Range Cloud Seeding Experiment,
W75-04721 3B

CLOUDBURSTS
Some Intra-Storm Characteristics of High-Intensity Rainfall Bursts,
W75-04689 2B

COAGULATION
Turbidity Removal Using Polymers and Activated Carbon,
W75-04820 5F

Coagulation-Filtration Practice as Related to Research.
W75-04825 5D

COAL MINE WASTES
Method for Treatment of Coal Washery Waters,
W75-04463 5D

Acid Mine Water, A Bibliography,
W75-04625 5G

COALESCENCE
The Coalescence of Water Drops,
W75-04728 1A

COASTAL ZONE
Coastal Mapping Act,
W75-04582 6E

COASTAL ZONE MANAGEMENT
An Operational Framework for Coastal Zone Management Planning.
W75-04558 6A

A Brief Historical Survey of Freedom of the Seas,
W75-04648 6E

Offshore Oil Drilling at Santa Barbara, Part 1,
W75-04784 6E

COASTAL ZONE MANAGEMENT ACT
Coastal Resources Management and Conservation Report Published,
W75-04583 2L

COASTS
Rookery Bay: Ecological Constraints on Coastal Development,
W75-04354 5C

Coastal Resources Management and Conservation Report Published,
W75-04583 2L

COLLISION-COALESCENCE PROCESS
The Coalescence of Water Drops,
W75-04728 1A

COLORADO
Routine Surveillance Alternatives for Water Quality Management,
W75-04803 5A

COLORADO RIVER
Effects of Agricultural Acreage Reduction on Water Availability and Salinity in the Upper Colorado River Basin,
W75-04368 6B

Procedural Methods for Implementing Colorado River Water Conservation Measures.
W75-04778 6E

COMBINED REFUSE/SEWAGE TREATMENT
An Assessment of Wet Systems for Residential Refuse Collection: Summary Report,
W75-04577 5D

COMBINED SEWERS
Control Strategy Development Study, San Francisco Wastewater Master Plan,
W75-04352 5D

COMMERCIAL FISHING
Crisis in the South Pacific: Tunaboat Seizures,
W75-04649 6E

COMPOSTING
Indiana Poultrymen are Composting Poultry Manure,
W75-04552 5D

COMPREHENSIVE PLANNING
Final Environmental Statement Related to the Proposed Clinton Power Station Units 1 and 2, Illinois Power Company.
W75-04395 5G

Final Environmental Statement Related to Construction of River Bend Nuclear Power Station, Units 1 and 2, Gulf States Utilities Company.
W75-04396 5G

Final Environmental Statement Related to the Proposed Pilgrim Nuclear Power Station Unit 2 Boston Edison Company.
W75-04397 5G

ASCE Urban Water Resources Research Program, 1967-1974,
W75-04440 4A

A Balanced Approach to Resource Extraction and Creative Land Development Associated with Open-Pit Copper Mining in Southern Arizona,
W75-04510 5G

The Urban Region Plan: Saint John, (New Brunswick), Urban Region Impact Study.
W75-04756 6B

Comprehensive Plan for Water, Sewer and Storm Drainage in the Lower Rio Grande Valley, (Volume II).
W75-04759 5D

A Compendium of Information, (The Metropolitan Toronto and Region Conservation Authority).
W75-04760 3D

Comprehensive Water and Sewer Plan for Alamance County, North Carolina,
W75-04765 5D

COMPUTER APPLICATIONS
Computer Use for River Regulation,
W75-04531 4A

COMPUTER MODELS
Design and Application of a Multipurpose Management Information System for Drinking Water Quality Assessment in Distribution Systems,
W75-04505 5G

Notes--Workshop on Computer-Aided Design and Simulation of Waste Treatment Systems,
W75-04518 5D

Isotopic and Chemical Considerations in Radiocarbon Dating of Groundwater Within the Arid Tucson Basin, Arizona,
W75-04647 7B

Computation of Air Flow Over Mountains in Statically Stable Situations,
W75-04663 2B

Orographic Influences on Distribution of Precipitation,
W75-04664 2B

A Hybrid Computer Simulation Model for Predicting the Effects of the Areal Distribution of Precipitation on Runoff Characteristics,
W75-04692 2B

Unsteady, Unsaturated, N-Dimensional Moisture Flow in Soil: A Computer Simulation Program,
W75-04701 2G

COMPUTER PROGRAMS
Notes--Workshop on Computer-Aided Design and Simulation of Waste Treatment Systems,
W75-04518 5D

Computer Use for River Regulation,
W75-04531 4A

Solution of Simultaneous Partial Differential Equations: An Extension of PDEL,
W75-04539 6A

Parameter Identification in Distributed Systems Using a Digital Simulation Language: An Extension of PDEL,
W75-04540 6A

Application of the Main II Water Forecasting System to Wyoming Communities,
W75-04541 6D

Areal Rainfall Analysis by Computer,
W75-04687 7C

Software for the Sigma-S,
W75-04731 7C

CONDEMNATION
Railroad and Canal Companies--Eminent Domain (As Amended),
W75-04580 6E

CONDENSATION
Recovery of Potable Water From Sanitary Waste Using Solid Wastes and Refuse as a Heat Source,
W75-04458 5D

Diurnal Variations in Cloud Condensation Nuclei,
W75-04711 2B

CONFINEMENT PENS
Tailor Made Confinement Barn,
W75-04617 5D

Nutrient Recovery: New Concept in Waste Handling,
W75-04620 5D

Slats in the Southwest,
W75-04621 5D

CONGERIA LEUCOPHAETA
The Effects of Mercuric Chloride Upon Respiration in Congeria Leucophaeta,
W75-04472 5C

CONGRESSIONAL HEARING
Offshore Oil Drilling at Santa Barbara, Part 1,
W75-04784 6E

CONGRESSIONAL HEARINGS
Amending the Act of July 4, 1955, as Amended, Relating to the Construction of Irrigation Distribution Systems.
W75-04597 6E

Flood Disaster Protection Act of 1973.
W75-04600 6F

Authorization for Secretary of Interior to Acquire Additional Wetlands.
W75-04651 6E

Amending the National Environmental Policy Act of 1969, to Provide for a National Environmental Data System.
W75-04785 6E

Nueces River Project, Texas, Part 1.
W75-04786 6E

Interim Nuclear Licensing.
W75-04788 6E

CONNECTICUT
An Operational Framework for Coastal Zone Management Planning.
W75-04558 6A

CONSTITUTIONAL LAW
Economic Disincentives for Pollution Control: Legal, Political, and Administrative Disincentives,
W75-04576 5G

CONSTRUCTION
Design, Construction and Launching of a Submarine Outfall Sewer at Whitstable,
W75-04536 5D

CONTACT WATER (OIL)
Contact (Oil) Water Determination in Terrestrial-Waters Using an Oceanographic Method,
W75-04502 5A

CONTAINMENT BOOMS
An Examination of Alternative Methods for Employing Booms to Contain Oil Spills in Navy Harbors,
W75-04720 5G

CONTINENTAL SHELF
Proposed 1973 Outer Continental Shelf Oil and Gas General Lease Sale Offshore Mississippi, Alabama, and Florida, Volume 4, (Final Environmental Statement),
W75-04589 5G

Proposed 1973 Outer Continental Shelf Oil and Gas General Lease Sale, Offshore Mississippi, Alabama, and Florida, Volume 5, (Final Environmental Statement),
W75-04590 5G

African Attitudes Toward the Law of the Sea,
W75-04771 6E

Offshore Oil Drilling at Santa Barbara, Part 1,
W75-04784 6E

CONTINUITY EQUATION
An Alternative Formulation of the Problem of Density Jump,
W75-04797 8B

CONTROL
Development of an Air Pollution Model for the San Francisco Bay Area. Third Semi annual Report to the National Science Foundation.
W75-04421 5A

Computer Control of Chemical Addition at a Water-Treatment Plant,
W75-04535 5F

Pierced Steel Planking Surfacing for Feedlot Runoff Control,
W75-04644 5D

CONTROL SYSTEMS
Control Strategy Development Study, San Francisco Wastewater Master Plan,
W75-04352 5D

Applicability of Control Strategies to the Activated Sludge Wastewater Treatment Process,
W75-04822 5D

COOLING WATER DISCHARGES
The Effect of Cooling Water Discharges on Zooplankton in a Bay of Lake Malaren,
W75-04496 5C

CORN (FIELD)
Comparison of Banded and Broadcast Fertilizer Applications in Relation to Compaction and Irrigation in Maize and Wheat,
W75-04611 3F

CORSICA (LAGOON OF BIGUGLIA)
Influence of Freshwater Dulution on Dynamics of Populations of Builder Crustaceans from Lagoon of Biguglia, Corsica (Corophium Insidiosum C., Tanais Cavolinii M.E., Erichthonius Brasiliensis D.), (In French),
W75-04490 2H

COST ANALYSIS
A Two-Dimensional Multi-Stage Programming Model: With Application to Reservoir Systems,
W75-04523 4A

Enforcement Economics in Air Pollution Control,
W75-04569 5G

COST-BENEFIT ANALYSIS
An Economic Analysis of Agricultural Land Use Practices to Control Water Quality,
W75-04526 5G

COSTS
Differences Between Planned and Actual Costs and Benefits in Small Watershed Development,
W75-04433 4D

Instrumentation Improves Water Treatment Plant Operation,
W75-04434 5F

Economics, (Literature Review),
W75-04846 5G

CRITICAL DEPTH METERS
Simplified Application of Palmer-Bowlus Flow Meters,
W75-04802 8B

CRITICAL PATH METHOD
Adoption of Network Techniques in the Planning and Execution of Irrigation and Power Projects,
W75-04533 3F

CROP PRODUCTION
Irrigation, Row width, and Plant Population in Relation to Growth Characteristics of Two Soybean Varieties,
W75-04369 3F

Range Plant Yield and Species Relationships in Natural and Partially Controlled Environments,
W75-04378 2I

Pattern of Water Availability and Water Requirement for Grain Sorghum Production at Samaru, Nigeria,
W75-04384 3F

The Role of Water and Land Resources in Alleviating Malnutrition and Hunger in Arid Regions,
W75-04603 6B

Model for Predicting Plant Yield as Influenced by Water Use,
W75-04609 2I

Some Effects of Subirrigation on Bentgrass During Heat Stress in the Field,
W75-04612 2I

Effects of Fertilizer and Available Moisture on the Yield and N and P Content of Wheat and on Soil Nutrients,
W75-04628 3F

CROP YIELD
Effect of Leaf Area Reduction on the Water Requirement of Barley (Hordeum Vulgare L.),
W75-04511 2I

CROPS
Effects of Cattle Feedlot Manure on Crop Yields and Soil Conditions,
W75-04833 5D

Manure Promoted for Cropland.
W75-04839 5G

CRUSTACEANS
Influence of Freshwater Dulution on Dynamics of Populations of Builder Crustaceans from Lagoon of Biguglia, Corsica (Corophium Insidiosum C., Tanais Cavolinii M.E., Erichthonius Brasiliensis D.), (In French),
W75-04490 2H

CYANIDES
Laboratory Study of Continuous Electrooxidation of Dilute Cyanide Wastes,
W75-04719 5D

CYPRESS CREEK (TEX)
Special Flood Hazard Information: Cypress Creek, Harris County, Texas.
W75-04742 4A

CYPRINODONTIDAE
Remarks on Bionomy of Family Cyprinodontidae (Pisces) with Respect to Dependency of Development of Embryos of Roloffia Foloffi (Ahl., 1938) on the Hardness of the Water, (In German),
W75-04494 2I

CZECHOSLOVAKIA (ORLIK VALLEY RESERVOIR)
Note on Growth of the Bream, Abramis Brama (Linnaeus, 1758) in the Orlik Valley Water Reservoir,
W75-04493 2I

DAIRY INDUSTRY
Economic and Environmental Considerations in Dairy Manure Management Systems,
W75-04543 5D

He Solved His Manure Handling Problem,
W75-04634 5D

Subfloor Monitoring of Shady Grove Dairy Liquid Manure Holding Pond,
W75-04640 5D

DATA COLLECTIONS
Planning for Water Quality in the Bear River System in the State of Utah.
W75-04757 5G

Amending the National Environmental Policy Act of 1969, to Provide for a National Environmental Data System.
W75-04785 6E

DATA PROCESSING
Computerized Calculation of Areal Precipitation and Its Accuracy,
W75-04688 7C

Estimating Areal Rainfall by Fitting Surfaces to Irregularly Spaced Data,
W75-04693 7C

Automation of the Collection and Analysis of Scientific Information in the Problem of the Interaction of the Atmosphere and Ocean,
W75-04729 2I

Automated System for Measurement, Collection and Processing of Hydrometeorological Data Aboard Scientific Research Vessels of the Gugms (Sigma-S),
W75-04730 7C

Software for the Sigma-S,
W75-04731 7C

The Problem of Organization of a Coastal Coordinating Computer Center,
W75-04732 7C

A System of Automated Processing of Deep Water Hydrological Information,
W75-04733 7C

Error in Interpolation and Choice of the Range of Discreteness in Measurements in a Hydrophysical Field,
W75-04734 7A

DATA STORAGE AND RETRIEVAL
Areal Rainfall Analysis by Computer,
W75-04687 7C

The Problem of Organization of a Coastal Coordinating Computer Center,
W75-04732 7C

DDT
Ecological History of DDT in Arizona,
W75-04387 5C

DECISION MAKING
A Framework for Uncertainty Management in Water Resources Planning,
W75-04519 6B

An Operational Framework for Coastal Zone Management Planning.
W75-04558 6A

DECISION THEORY
A Framework for Uncertainty Management in Water Resources Planning,
W75-04519 6B

DEFOLIATION
Effect of Leaf Area Reduction on the Water Requirement of Barley (Hordeum Vulgare L.),
W75-04511 2I

Effect of Leaf Area Reduction on the Water Requirement of Barley (Hordeum Vulgare L.),
W75-04511 2I

DEHYDRATION
Solid Adsorbents for Gas and Liquid Treatment,
W75-04826 5D

DEICERS
Manual for Deicing Chemicals: Application Practices,
W75-04567 5G

Manual for Deicing Chemicals: Storage and Handling,
W75-04568 5G

DEICING CHEMICALS
Manual for Deicing Chemicals: Application Practices,
W75-04567 5G

DELAWARE RIVER
The Effect of Temperature and Chemical Pollutants on the Behavior of Several Esturine Organisms,
W75-04353 5C

Delaware River Basin Compact: A Review with Respect to Environmental Quality,
W75-04361 6E

DELAWARE RIVER BASIN COMMISSION
Delaware River Basin Compact: A Review with Respect to Environmental Quality,

Regulation of Urban Development to Control Runoff and Erosion,
W75-04362 4D

Water Quality Control--The Role of the Interstate Agency,
W75-04596 5G

DELAWARE RIVER BASIN COMPACT
Delaware River Basin Compact: A Review with Respect to Environmental Quality,
W75-04361 6E

DEMAND
A Regional Model of the Future Demand For Transportation: The Case of Barge Transportation,
W75-04520 6A

DEMONSTRATION WATERSHEDS
Study of Subsurface Flow Into Mountain Streams as Related to Topography and Partial (Variable) Source Areas,
W75-04357 4D

The Varying Source Area of Streamflow from Upland Basins,
W75-04358 4D

The Distribution of Precipitation in Some Mountainous Canadian Watersheds,
W75-04671 2B

DENITRIFICATION
The Effect of Large Applications of Manure on Movement of Nitrate and Carbon in an Irrigated Desert Soil,
W75-04370 5G

Methods of Removing Nitrates From Water,
W75-04626 5D

DENSITY CURRENTS
An Alternative Formulation of the Problem of Density Jump,
W75-04797 8B

DENSITY JUMP
An Alternative Formulation of the Problem of Density Jump,
W75-04797 8B

DENSITY PROBES
The Effect of Soil Texture and Density on the Neutron and Density Probe Calibration for Some Tropical Soils,
W75-04549 2G

DENSITY STRATIFICATION
Rotating Hydraulics of Strait and Sill Flows,
W75-04716 2L

DES PLAINES RIVER (ILL-WIS)
Flood Plain Information: Report on the Des Plaines River, Illinois and Wisconsin.
W75-04746 4A

DESALINATION
Effects of Agricultural Acreage Reduction on Water Availability and Salinity in the Upper Colorado River Basin,
W75-04368 6B

The World's Largest Desalting Complex--A Report on Twenty Years Experience,
W75-04422 3A

Geothermal Wells in Imperial Valley, California: Desalting Potentials, Historical Development, and A Selected Bibliography,
W75-04423 3A

Utilization of the Earth's Natural Heating System to Desalt Geothermal Brines for Augmentation of the Colorado River System,
W75-04430 3A

Process and Apparatus for Separating Water From Non-Volatile Solutes,
W75-04451 3A

Vertical, Multistage-Flash, Falling Film Column for Distilling Brine,
W75-04459 3A

Method and Apparatus for Producing a Distillate,
W75-04465 3A

Hydrate Forming in Water Desalination,
W75-04466 3A

Methods of Removing Nitrates From Water,
W75-04626 5D

DESALINATION PLANTS
Universal Design of a 2.5 MGD Universal Desalting Plant, Revised: Volume 1.
W75-04850 3A

DESALINATION PROCESSES
The World's Largest Desalting Complex--A Report on Twenty Years Experience,
W75-04422 3A

DESERT PLANTS
The Influence of Soil Water Potential on the Perennial Vegetation of a Desert Arroyo,
W75-04365 2I

Phenological Events and Their Environmental Triggers in Mojave Desert Ecosystems,
W75-04385 2I

DESERTS
Distribution of Different Forms of Nitrogen in Some Desert Soils,
W75-04373 2G

DESIGN
Design and Application of a Multipurpose Management Information System for Drinking Water Quality Assessment in Distribution Systems,
W75-04505 5G

Notes--Workshop on Computer-Aided Design and Simulation of Waste Treatment Systems,
W75-04518 5D

A systems Analysis of Water Quality Survey Design,
W75-04522 5B

The Design of a Livestock Water Distribution System--Large Scale,
W75-04527 3F

Design, Construction and Launching of a Submarine Outfall Sewer at Whitstable,
W75-04536 5D

Tentative Criteria for Design, Construction and Operation of the Batch Type Pasveer Oxidation Ditch System for the Treatment of Animal Wastes,
W75-04636 5D

Settling Basin Design for Raceway Fish Production Systems,
W75-04646 5D

Rational Basis for Septic Tank System Design,
W75-04801 5D

DESIGN

Development of Guidelines for the Design of Subsurface Drainage Systems for Highway Pavement Structural Sections,
W75-04809 8A

DESIGN CRITERIA
Water Management Systems,
W75-04538 3F

Tertiary Treatment: The Wrong Solution to a Non-Problem,
W75-04811 5D

DESIGN DATA
Hydraulic Analysis of Winnipeg Sump Inlets,
W75-04804 5D

DESIGN FLOW
A Method for Determining Peak Flows and Detention Storage Requirements in Urbanizing Areas.
W75-04694 4A

DESIGN STANDARDS
Universal Design of a 2.5 MGD Universal Desalting Plant, Revised: Volume 1.
W75-04850 3A

DESIGN STORM
Some Intra-Storm Characteristics of High-Intensity Rainfall Bursts,
W75-04689 2B

DETERGENTS
Biodegradability of a Carboxymethyloxysuccinate Detergent Builder,
W75-04426 5D

Trickling Filtration of a Waste Containing NTA,
W75-04427 5D

DEWATERING
Dewatering Bovine Animal Manure,
W75-04627 5D

DIATOMS
Environmental Requirements and Pollution Tolerance of Freshwater Diatoms,
W75-04563 5C

DIET
Effect of Ration on Manure Salt Content,
W75-04834 5D

DIFFUSIVE MODELS
Simple Albedo Feedback Models of the Icecaps,
W75-04794 2C

DIFFUSIVITY
Salt and Water Movement in Relatively Dry Soil,
W75-04516 2G

DIGESTORS
New Aerobic Process Turns Waste to Nutrients,
W75-04619 5D

DIMICTIC LAKES
Temperature Dynamics in Dimictic Lakes,
W75-04705 2H

DIPTERA
Some Effects of Spring Snowmelt Runoff on Aquatic Invertebrate Populations in a High Moutain Stream,
W75-04450 2I

DISCHARGE COEFFICIENT
Simplified Application of Palmer-Bowlus Flow Meters,
W75-04802 8B

Hydraulic Analysis of Winnipeg Sump Inlets,
W75-04804 5D

DISCHARGE (WATER)
Complying with Discharge Regulations,
W75-04431 5G

DISEASES
Medical Uses of Isotopes,
W75-04417 5C

DISINCENTIVES (ECONOMIC)
Economic Disincentives for Pollution Control: Legal, Political, and Administrative Disincentives,
W75-04576 5G

DISINFECTION
Method for Electrosanitizing Waste Water,
W75-04464 5D

DISSOLVED OXYGEN
Biologic Detection and Control of Water Pollution,
W75-04447 5C

DISTILLATION
The World's Largest Desalting Complex--A Report on Twenty Years Experience,
W75-04422 3A

Process and Apparatus for Separating Water From Non-Volatile Solutes,
W75-04451 3A

Vertical, Multistage-Flash, Falling Film Column for Distilling Brine,
W75-04459 3A

Method and Apparatus for Producing a Distillate,
W75-04465 3A

DISTRIBUTION PATTERNS
Vertical Distribution of Freshwater Mussels (Pelecypoda, Unionidae) in Southwestern Finland,

Water-Distribution Research and Applied Development Needs.
W75-04763 6B

Routine Surveillance Alternatives for Water Quality Management,
W75-04803 5A

Amounts, Composition, and Management of Feedlot Runoff,
W75-04835 5D

MAPPING
Areal Rainfall Analysis by Computer,
W75-04687 7C

MAPS
Coastal Mapping Act,
W75-04582 6E

Physiographically Adjusted Precipitation-Frequency Maps,
W75-04672 2B

MARINE ALGAE
Comparative Photosynthetic Capacities of Intertidal Algae Under Exposed and Submerged Conditions,
W75-04524 5C

MARINE GEOLOGY
High-Level Radioactive Waste Management Alternatives - Section 6: Seabed Disposal,
W75-04406 5D

MARKETABLE EFFLUENT PERMITS
An Evaluation of Marketable Effluent Permit Systems,
W75-04571 5G

MARYLAND
Tenth Annual Report, Program Activities, July 1, 1973 - June 30, 1974.
W75-04654 9D

Flood Plain Information: (Patuxent River) Western Branch (Folly, Lottsford and Vald Hill Br.), Prince Georges County, Maryland.
W75-04754 4A

MARYLAND (PATUXENT ESTUARY)
Abundance, Diversity and Seasonal Patterns of Estuarine Fish Populations,
W75-04485 5C

MASS WASTING
Soil Erosion and Sediment Transport from Gullies,
W75-04707 2J

MASSACHUSETTS
Final Environmental Statement Related to the Proposed Pilgrim Nuclear Power Station Unit 2 Boston Edison Company.
W75-04397 5G

Particulate Matter at the Sediment-Water Interface in Coastal Environments,
W75-04497 2L

MASSACHUSETTS (BUZZARDS BAY)
Benthic Community Respiration Near the Woods Hole Sewage Outfall,
W75-04503 5C

MASSACHUSETTS (NARRAGANSETT BAY)
Petroleum Hydrocarbons in Narragansett Bay: I. Survey of Hydrocarbons in Sediments and Clams (Mercenaria Mercenaria),
W75-04477 5B

Petroleum Hydrocarbons in Narragansett Bay: II. Chemical and Isotopic Analysis,
W75-04478 5B

MATHEMATICAL MODELS
The Development of a Mathematical Model to Predict Runoff Water Quality from Watersheds,
W75-04551 5B

Optimal Weighting Function in Water Quality Modeling,
W75-04614 5B

Computation of Air Flow Over Mountains in Statically Stable Situations,
W75-04663 2B

Evaluation Problem of Storm Water Routing Mathematical Models,
W75-04708 5D

Small Parametric Model of the Precomputation of Meteorological Fields on the Basis of Complete Equations and Its Energetic Analogs,
W75-04736 7C

Estimate of Heat Fluxes on the Subjacent Surface (According to Data from Synoptic Analysis),
W75-04737 7C

A Small-Parameter Model of Circulation in an Homogeneous Baroclinic Ocean,
W75-04738 2L

Simple Albedo Feedback Models of the Icecaps,
W75-04794 2C

MATHEMATICAL PROGRAMMING
Control Strategy Development Study, San Francisco Wastewater Master Plan,
W75-04352 5D

MAXIMUM PROBABLE FLOOD
Flood Plain Information -- Williamson Creek, Austin, Texas.
W75-04747 4A

Flood Plain Information -- Goose Creek, Baytown, Texas.
W75-04750 4A

MEAN HIGH WATER LINE
Coastal Mapping Act,
W75-04582 6E

MEASUREMENT
Temperature Measurements and Internal Waves in Senaca Lake, New York,
W75-04400 2H

adiation Instrumentation - Radiological
hemistry,
V75-04411 5A

adiation Dosimetry,
/75-04414 5C

eficiencies in Measured Snow Precipitation in
Mountainous Area in Norway,

ALS
rces of Metals in New York City Waste-
er,
5-04805 5B

ce Metals in Wastewater Effluents,
5-04806 5B

METEORIC WATER
Lysimeter Experiment Description and Progress Report on Neutron Measurements,
W75-04725 2D

METEOROLOGY
Automation of the Collection and Analysis of Scientific Information in the Problem of the Interaction of the Atmosphere and Ocean,
W75-04729 2B

Software for the Sigma-S,
W75-04731 7C

Small Parametric Model of the Precomputation of Meteorological Fields on the Basis of Complete Equations and Its Energetic Analogs,
W75-04736 7C

Estimate of Heat Fluxes on the Subjacent Surface (According to Data from Synoptic Analysis),
W75-04737 7C

A Critical Examination of the Turbulence Instrument used in the Marsta Micro-Meteorological Field Project,
W75-04795 7B

METHANE BACTERIA
Interrelations Between Sulfate-Reducing and Methane-Producing Bacteria in Bottom Deposits of a Fresh-Water Lake. I. Field Observations,
W75-04469 5C

Interrelations Between Sulfate-Reducing and Methane-Producing Bacteria in Bottom Deposits of a Fresh-Water Lake. II. Inhibition Experiments,
W75-04470 5C

METHODOLOGY
A Framework for Uncertainty Management in Water Resources Planning,
W75-04519 6B

A Regional Model of the Future Demand For Transportation: The Case of Barge Transportation,
W75-04520 6A

METHYLMERCURY
Mercury in Aquatic Systems: Methylation, Oxidation-Reduction, and Bioaccumulation,
W75-04570 5B

MICE
Dose-Rate Effect on Life Shortening in Mice,
W75-04398 5C

MICHIGAN
In Re Highway US-24, in Bloomfield Township, Oakland County (Highway Condemnation Proceeding).
W75-04776 6E

Water Pollution--Liquid Wastes (As Amended).
W75-04777 5G

Sampling of Variable, Waste-Migration Patterns in Ground Water,
W75-04799 5B

MICRODENSITOMETERS
Water Quality by Photographic Analysis,
W75-04814 5A

MICROGRAPHS (THREE DIMENSIONAL)
Method for the Construction of Three-Dimensional Electron Micrographs,
W75-04394 5A

MICROMETEOROLOGY
Micrometeorological Measurements for Pesticide Drift Studies,
W75-04714 5B

MILKING MACHINE COMPRESSOR
Mechanical Aeration of a Waste Disposal Manure Pit,
W75-04841 5D

MINE DRAINAGE
Acid Mine Water, A Bibliography,
W75-04625 5G

MINE WASTES
Method for Treatment of Coal Washery Waters,
W75-04463 5D

A Balanced Approach to Resource Extraction and Creative Land Development Associated with Open-Pit Copper Mining in Southern Arizona,
W75-04510 5G

MINNESOTA
Asbestiform Amphibole Minerals: Detection and Measurement of High Concentrations in Municipal Water Supplies,
W75-04818 5A

MISSISSIPPI
Raindrop Characteristics in South Central United States,
W75-04713 2B

A Survey of Federal and Mississippi Environmental Law with an Examination of its effect on Land Development,
W75-04845 6G

MISSISSIPPI RIVER
Final Environmental Statement Related to Construction of River Bend Nuclear Power Station, Units 1 and 2, Gulf States Utilities Company.
W75-04396 5G

MISSOURI
Inadvertent Rain Modification as Indicated by Surface Raincells,
W75-04703 2B

MODEL STUDIES
Study of Subsurface Flow Into Mountain Streams as Related to Topography and Partial (Variable) Source Areas,
W75-04357 4D

The Varying Source Area of Streamflow from Upland Basins,
W75-04358 4D

Supersonic Aircraft and the Ozone Layer,
W75-04393 5A

Recipient Radiation Exposure - Circulatory Support Systems,
W75-04419 5C

Development of an Air Pollution Model for the San Francisco Bay Area. Third Semi annual Report to the National Science Foundation.

Nonpoint Agricultural Pollution: Status of Assessment Methodology,
W75-04645 5B

Isotopic and Chemical Considerations in Radiocarbon Dating of Groundwater Within the Arid Tucson Basin, Arizona,
W75-04647 7B

A Hybrid Computer Simulation Model for Predicting the Effects of the Areal Distribution of Precipitation on Runoff Characteristics,
W75-04692 2B

The Coalescence of Water Drops,
W75-04728 1A

Automation of the Collection and Analysis of Scientific Information in the Problem of the Interaction of the Atmosphere and Ocean,
W75-04729 2B

Reconstructing the Vertical Profile of Humidity on the Basis of the Vertical Profile of Temperature,
W75-04741 2B

Applicability of Control Strategies to the Activated Sludge Wastewater Treatment Process,
W75-04822 5D

MOHAWK RIVER (NY)
An Evaluation of Marketable Effluent Permit Systems,
W75-04571 5G

MOISTURE
Relative Influence of Moisture-Aeration and Nutrients on Vegetation and Black Spruce Growth in Northern Ontario,
W75-04837 2I

MOISTURE CONTENT
The Effect of Initial Moisture Content and Infiltration Quantity of Redistribution of Soil Water,
W75-04517 2G

A Nondestructive Method of Following Moisture Content and Temperature Changes in Soils Using Thermistors,
W75-04605 2G

Effects of Fertilizer and Available Moisture on the Yield and N and P Content of Wheat and on Soil Nutrients,
W75-04628 3F

Atmospheric Moisture Parameterization,
W75-04724 2B

MOJAVE DESERT
Phenological Events and Their Environmental Triggers in Mojave Desert Ecosystems,
W75-04385 2I

MOMENTUM EQUATION
An Alternative Formulation of the Problem of Density Jump,
W75-04797 8B

MONITORING
The Unreliability of Tile Effluent for Monitoring Subsurface Nitrate-Nitrogen Losses from Soils,
W75-04438 5B

Acid-Iron Waste as a Factor Affecting the Distribution and Abundance of Zooplankton in the New York Bight: II. Spatial Variations in the Field and Implications for Monitoring Studies,
W75-04574 5B

Subfloor Monitoring of Shady Grove Dairy Liquid Manure Holding Pond,
W75-04640 5D

Routine Surveillance Alternatives for Water Quality Management,
W75-04803 5A

MONTANA
Atmospheric Water Resources Management Program - Bridger Range Cloud Seeding Experiment,
W75-04721 3B

MONTANA (GALLATIN RIVER)
Suspended Solids Carried by the Gallatin River of Southwestern Montana: Amounts Carried During Spring Runoff,
W75-04501 2J

MOOUNTAINS
Methods for the Study of Laws for the Distribution of Precipitation in Medium-High Mountains (Illustrated by the Vitim River Basin),
W75-04669 2B

MOSQUITO LARVAE
Studies on the Effectiveness of the Guppy Poecilia Reticulata in Controlling Culex Pipiens S.L.:I. Laboratory Experiments on Predation Behavior, (In Japanese),
W75-04382 5G

MOTORS (OUTBOARD)
The Effects of the Interaction of Outboard Motors with the Aquatic Environment: A Review,
W75-04816 5C

MOUNTAINS
Improved Instrumentation for Measuring Melted Precipitation on Windswept Topography,
W75-04655 7B

Precipitation Measurements by Means of Storage Gauges with Stereo and Horizontal Orifices in the Baye De Montreux Watershed,
W75-04656 7B

Snow Survey and Methods for Snow Storage Estimation in Mountain River Basins of the Soviet Union,
W75-04659 2C

A Possibility of Airflow - Precipitation Regime Investigations,
W75-04660 2B

Rainfall at the Hohenpeissenberg and the Weather Situation,
W75-04662 2B

Computation of Air Flow Over Mountains in Statically Stable Situations,
W75-04663 2B

Distribution of Precipitation in the Sognefjord Region,
W75-04665 2B

About Vertical Gradients of Liquid Precipitation in Mountains,
W75-04668 2B

Relation of Orographic Winter Precipitation Patterns to Meteorological Parameters,
W75-04670 2

The Characteristic Changes of the Amount of Precipitation in Connection with Altitude in the Mountainous Areas of Yugoslavia,
W75-04673 2B

Distribution of Precipitation in Mountainous Areas of West Pakistan,
W75-04674 2B

Precipitation in Taiwan Mountainous Areas,
W75-04675 2B

Orographic Influences on the Distribution o Precipitation,
W75-04676 2B

Influence of Orography on the Share o Precipitation in the East Alpine High Mountains,
W75-04679 2B

Precipitation Estimates from Meteorologica Satellite Data,
W75-04685 2B

MULTI-LEVEL PROGRAMMING
An Operational Framework for Coastal Zon Management Planning.
W75-04558 6

MULTIPLE-PURPOSE PROJECTS
Authorizing the Secretary of the Interior t Construct, Operate, and Maintain the Touch Division, Walla Walla Project, Orego Washington, and for Other Purposes.
W75-04790 6

MULTIPLE-PURPOSE RESERVOIRS
A Two-Dimensional Multi-Stage Programmi Model: With Application to Reservoir System
W75-04523 4

Computer Use for River Regulation,
W75-04531 4

Optimal Operation of Multiple Reserv System,
W75-04532 4

MULTIPLE REGRESSION ANALYSIS
Demand for Irrigation: A Case Study Government Tube-Wells in Uttar Pradesh,
W75-04529 6

MULTIPLE RESERVOIR SYSTEMS
Optimal Operation of Multiple Reservoir System,
W75-04532 4A

MUNICIPAL WASTES
More Than a Myriad.
W75-04829 5D

MUNICIPAL WATER
Recovery of Potable Water From Sanitary Waste Using Solid Wastes and Refuse as a Heat Source,
W75-04458 5D

Asbestiform Amphibole Minerals: Detection and Measurement of High Concentrations in Municipal Water Supplies,
W75-04818 5A

Sewage Treatment in the Potteries,
W75-04823 5D

MUSSELS (FRESHWATER)
Vertical Distribution of Freshwater Mussels (Pelecypoda, Unionidae) in Southwestern Finland,
W75-04486 2I

MUTATIONS
Radiation Biophysics,
W75-04415 5C

NATIONAL ENVIRONMENTAL POLICY ACT
EPA to Issue Impact Statements on Some Regulatory Actions,
W75-04586 5G

Amending the National Environmental Policy Act of 1969, to Provide for a National Environmental Data System.
W75-04785 6E

Interim Nuclear Licensing.
W75-04788 6E

NAVIGABLE WATERS
Permit Provisions Adopted for Ocean Water Activity,
W75-04587 5G

NEBRASKA
The Design of a Livestock Water Distribution System--Large Scale,
W75-04527 3F

Reducing Feedlot Nitrates in Your Ground Water,
W75-04547 5B

NEEDLE GROWTH (PINES)
Fascicle Density and Needle Growth Responses of Red Pine to Water Supply Over Two Seasons,
W75-04424 2I

NETWORK DESIGN
Spectra of Precipitation Series in Mountainous Regions,
W75-04682 7A

The use of the Modified Time Series Analysis Technique for The Determination of Areal Precipitation Accuracies,
W75-04683 2B

NETWORKS
Some Characteristics of Hawaiian High-Intensity Rainfall,
W75-04442 2B

A Two-Dimensional Multi-Stage Programming Model: With Application to Reservoir Systems,
W75-04523 4A

Adoption of Network Techniques in the Planning and Execution of Irrigation and Power Projects,
W75-04533 3F

NEUTRON ABSORPTION
Lysimeter Experiment Description and Progress Report on Neutron Measurements,
W75-04725 2D

NEUTRON ACTIVATION ANALYSIS
Identification and Evaluation of Water Tracers Amenable to Post-Sampling Neutron Activation Analysis,
W75-04355 5A

NEUTRON PROBES
The Effect of Soil Texture and Density on the Neutron and Density Probe Calibration for Some Tropical Soils,
W75-04549 2G

NEVADA
Numerical Simulation of Unsteady Flow Hydraulics of Truckee River,
W75-04444 6A

NEW GUINEA
A Hydrological Assessment of Precipitation in the Western Highlands of New Guinea,
W75-04690 2B

NEW HAMPSHIRE
Deposition of Water and Cations on Artificial Foliar Collectors in Fir Krummholz of New England Mountains,
W75-04471 2K

NEW JERSEY
Farms are Not in the Country Any More,
W75-04546 5D

Bergen County Sewer Authority V. Hackensack Meadowlands Development Commission (Seeking Declaratory Judgment that Plaintiff not Subject to Land Use Regulations of Defendant in Constructing Addition to Sewage Plant).
W75-04780 6E

NEW YORK
Temperature Measurements and Internal Waves in Senaca Lake, New York,
W75-04400 2H

An Evaluation of State Land Use Planning and Development Control in the Adirondacks,
W75-04445 6E

An Evaluation of Marketable Effluent Permit Systems,
W75-04571 5G

Zahn, ET AL. V. International Paper Co. (Class Action Seeking Damages from Discharges),
W75-04588 6E

OIL INDUSTRY
Offshore Oil Drilling at Santa Barbara, Part 1,
W75-04784 6E

OIL-LAYER THICKNESS
Determination of the Thickness of Petroleum Films on Water,
W75-04723 5A

OIL POLLUTION
Methods for Elimination of Oil Slicks,
W75-04455 5G

Petroleum Hydrocarbons in Narragansett Bay: I. Survey of Hydrocarbons in Sediments and Clams (Mercenaria Mercenaria),
W75-04477 5B

Contact (Oil) Water Determination in Terrestrial-Waters Using an Oceanographic Method,
W75-04502 5A

Determination of the Molecular Solubility of Navy Oils in Water,
W75-04722 5A

Determination of the Thickness of Petroleum Films on Water,
W75-04723 5A

The Law of Maritime Oil Spills,
W75-04770 6E

OIL SPILLS
Methods for Elimination of Oil Slicks,
W75-04455 5G

Littoral Fish Populations After an Oil Tanker Disaster in the Finnish SW Archipelago,
W75-04487 5C

An Examination of Alternative Methods for Employing Booms to Contain Oil Spills in Navy Harbors,
W75-04720 5G

Determination of the Thickness of Petroleum Films on Water,
W75-04723 5A

Amelioration of Effects of Oil Spills.
W75-04779 5G

OIL WASTES
Used Oil Law in the United States and Europe,
W75-04575 5G

Measurement of Hydrocarbons in Water: Application to Cases of Surface Water Pollution,
W75-04709 5A

OIL WELLS
Proposed 1973 Outer Continental Shelf Oil and Gas General Lease Sale Offshore Mississippi, Alabama, and Florida, Volume 4, (Final Environmental Statement),
W75-04589 5G

OKLAHOMA
Authorizing the City of Sherman, Tex., to Construct a Barrier in Denison Dam (Lake Texoma) Red River, Tex. and Okla., for the Purpose of Providing a Municipal and Industrial Water Supply.
W75-04789 6E

OLIGOTROPHIC SEAS
Internal Waves as Causative Mechanisms of Island Mass Effects,
W75-04481 5C

ON-SITE DATA COLLECTIONS
Energy Budget Measurements Over Three Cover Types in Eastern Arizona,
W75-04383 2I

ON-SITE INVESTIGATIONS
Virological Studies in Water Systems: Natural Occurrence of Reoviruses and Their Inactivation by Physical and Chemical Agents,
W75-04821 5F

OPEN CHANNEL FLOW
Simplified Application of Palmer-Bowlus Flow Meters,
W75-04802 8B

OPERATING POLICY
Optimal Operation of Multiple Reservoir System,
W75-04532 4A

OPERATION AND MAINTENANCE
Tertiary Treatment: The Wrong Solution to a Non-Problem,
W75-04811 5D

OPERATIONS
Instrumentation Improves Water Treatment Plant Operation,
W75-04434 5F

Optimal Operation of Multiple Reservoir System,
W75-04532 4A

Tentative Criteria for Design, Construction and Operation of the Batch Type Pasveer Oxidation Ditch System for the Treatment of Animal Wastes,
W75-04636 5D

OPERATIONS RESEARCH
Lignin Separation by Continuous Ion Flotation: Investigation of Physical Operational Parameters,
W75-04476 5D

OPTIMIZATION
Control Strategy Development Study, San Francisco Wastewater Master Plan,
W75-04352 5D

Instrumentation Improves Water Treatment Plant Operation,
W75-04434 5F

Optimal Operation of Multiple Reservoir System,
W75-04532 4A

Parameter Identification in Distributed Systems Using a Digital Simulation Language: An Extension of PDEL,
W75-04540 6A

An Operational Framework for Coastal Zone Management Planning.
W75-04558 6A

Optimal Weighting Function in Water Quality Modeling,
W75-04614 5B

ORDINANCES
Regulation of Urban Development to Control Runoff and Erosion,
W75-04362 4D

OREGON
Subsurface Sewage Disposal and Contamination of Ground Water in East Portland, Oregon,
W75-04798 5B

ORGANIC COMPOUNDS
Organic Compounds Entering Ground Water from a Landfill,
W75-04573 5B

Measurement of Hydrocarbons in Water: Application to Cases of Surface Water Pollution,
W75-04709 5A

ORGANIC WASTES
Recycle Organic Wastes as Feed for Meat Animals.
W75-04556 5D

Comparative Changes in Soil-Physical Properties Induced by Admixtures of Manures from Various Domestic Animals,
W75-04602 2G

Settling Basin Design for Raceway Fish Production Systems,
W75-04646 5D

ORGANIC WASTES *WASTE TREATMENT
Changing from Dumping to Recycling. Part 2. Organic Wastes,
W75-04642 5D

OROGRAPHY
Orographic Influences on Distribution of Precipitation,
W75-04664 2B

Relation of Orographic Winter Precipitation Patterns to Meteorological Parameters,
W75-04670 2

Physiographically Adjusted Precipitation-Frequency Maps,
W75-04672 2B

The Characteristic Changes of the Amount of Precipitation in Connection with Altitude in the Mountainous Areas of Yugoslavia,
W75-04673 2B

Precipitation in Taiwan Mountainous Areas,
W75-04675 2B

Orographic Influences on the Distribution of Precipitation,
W75-04676 2B

Water Yield as an Index of Lee and Windward Topographic Effects on Precipitation,
W75-04678 2B

Influence of Orography on the Share of Precipitation in the East Alpine High Mountains,
W75-04679 2B

OROGRAPHY

Study of Orographic Effect on Optimum Number of Raingauges,
W75-04681 7A

OSMOSIS
Determination of the Molecular Solubility of Navy Oils in Water,
W75-04722 5A

OUTFALL SEWERS
Design, Construction and Launching of a Submarine Outfall Sewer at Whitstable,
W75-04536 5D

More Than a Myriad.
W75-04829 5D

OVERFLOW
Control Strategy Development Study, San Francisco Wastewater Master Plan,
W75-04352 5D

OWNERSHIP OF BEDS
The International Seabed Regime: Proposals and Prospects for Realization,
W75-04767 6E

OXIDATION
Method for Electrosanitizing Waste Water,
W75-04464 5D

OXIDATION DITCH
A Prototype System to Renovate and Recycle Swine Wastes Hydraulically,
W75-04542 5D

OXIDATION LAGOONS
A Prototype System to Renovate and Recycle Swine Wastes Hydraulically,
W75-04542 5D

Characteristics and Soil Treatment of Biologically Treated Swine Wastes, Vol. I, CH.1 Thru 3,
W75-04623 5D

Characteristics and Soil Treatment of Biologically Treated Swine Waste, Vol II, Ch. 4, Thru 7,
W75-04624 5D

Tentative Criteria for Design, Construction and Operation of the Batch Type Pasveer Oxidation Ditch System for the Treatment of Animal Wastes,
W75-04636 5D

In-The-Building Oxidation Ditches for Livestock Wastes,
W75-04643 5D

OXYGEN
Supersonic Aircraft and the Ozone Layer,
W75-04393 5A

OXYGEN-18
Relative Rates of Flow of the Negro and Solimoes Rivers (Determined) Through O18 Concentrations, (In Porteguese),
W75-04495 2E

OXYGEN SAG
Oxygen Sag and Stream Purification, (Literature Review),
W75-04849 5B

OXYGENATION
Environment, Energy Costs Suggest Oxygen Activated Sludge as Wastewater Treatment Approach,
W75-04827 5D

OZONE
Supersonic Aircraft and the Ozone Layer,
W75-04393 5A

Closed-Loop Ozone Generating and Contacting System,
W75-04461 5D

Kinetics in Ozone Treatment of Secondary Sewage Effluents, (In Japanese),
W75-04831 5D

PACIFIC NORTHWEST U.S.
Manure Application Guidelines for the Pacific Northwest,
W75-04631 5G

PAKISTAN
Distribution of Precipitation in Mountainous Areas of West Pakistan,
W75-04674 2B

PALMER-BOWLUS FLUMES
Simplified Application of Palmer-Bowlus Flow Meters,
W75-04802 8B

PARKS
An Evaluation of State Land Use Planning and Development Control in the Adirondacks,
W75-04445 6E

PATENTS
Process and Apparatus for Separating Water From Non-Volatile Solutes,
W75-04451 3A

Winch-Driven Irrigation Apparatus,
W75-04452 3F

Floating Wave Barrier,
W75-04453 8A

Apparatus for the Filtration and Biological Purification of Contaminated Water,
W75-04454 5D

Methods for Elimination of Oil Slicks,
W75-04455 5G

Sewage Treatment System,
W75-04456 5D

Water Clarification with Nitrogen-Heterocyclic Phosphonic Acids,
W75-04457 5D

Recovery of Potable Water From Sanitary Waste Using Solid Wastes and Refuse as a Heat Source,
W75-04458 5D

Vertical, Multistage-Flash, Falling Film Column for Distilling Brine,
W75-04459 3A

Self-Reconditioning Filter Apparatus for Continuous Removal of Solids From a Stream of Liquid,
W75-04460 5D

Closed-Loop Ozone Generating and Contacting System,
W75-04461 5D

Method for Treatment of Coal Washery Waters,
W75-04463 5D

Method for Electrosanitizing Waste Water,
W75-04464 5D

Method and Apparatus for Producing a Distillate,
W75-04465 3A

Hydrate Forming in Water Desalination,
W75-04466 3A

Inflatable Barriers for Watercourses,
W75-04467 8A

PATH OF POLLUTANTS
The Use of Chironomid Pupal Exuviae for Characterizing Streams,
W75-04371 5B

The Unreliability of Tile Effluent for Monitoring Subsurface Nitrate-Nitrogen Losses from Soils,

SIMULTANEOUS PARTIAL DIFFERENTIAL EQUATION
Solution of Simultaneous Partial Differential Equations: An Extension of PDEL,
W75-04539 6A

SIMULTATED RAINFALL
Polyvinyl Alcohol as a Stabilizer of Surface Soil,
W75-04607 2G

SITES
Final Environmental Statement Related to the Proposed Clinton Power Station Units 1 and 2, Illinois Power Company.
W75-04395 5G

Final Environmental Statement Related to Construction of River Bend Nuclear Power Station, Units 1 and 2, Gulf States Utilities Company.
W75-04396 5G

Final Environmental Statement Related to the Proposed Pilgrim Nuclear Power Station Unit 2 Boston Edison Company.
W75-04397 5G

SLATS
Slats in the Southwest,
W75-04621 5D

SLUDGE DISPOSAL
Fluidized-Bed Sludge Incinerator Design,
W75-04428 5D

SLURRIES
Development of an Organic Waste Slurry Injector,
W75-04616 5D

SMALL WATERSHEDS
Study of Subsurface Flow Into Mountain Streams as Related to Topography and Partial (Variable) Source Areas,
W75-04357 4D

The Varying Source Area of Streamflow from Upland Basins,
W75-04358 4D

Energy Budget Measurements Over Three Cover Types in Eastern Arizona,
W75-04383 2I

Differences Between Planned and Actual Costs and Benefits in Small Watershed Development,
W75-04433 4D

SNOW
Statistical Considerations About Snow Conditions in the Austrian Alps,
W75-04667 2C

Deficiencies in Measured Snow Precipitation in a Mountainous Area in Norway,
W75-04684 2C

SNOW COURSES
Snow Survey and Methods for Snow Storage Estimation in Mountain River Basins of the Soviet Union,
W75-04659 2C

SNOW COVER
Analysis of Snow Cover Distribution from Aerophotography Data Over Experimental Mountain Basin of Varzob River,
W75-04658 7B

SNOW REMOVAL
Manual for Deicing Chemicals: Storage and Handling,
W75-04568 5G

SNOW REMOVAL *MAINTENANCE
Manual for Deicing Chemicals: Application Practices,
W75-04567 5G

SNOWFALL
Snow Survey and Methods for Snow Storage Estimation in Mountain River Basins of the Soviet Union,
W75-04659 2C

SNOWMELT
Some Effects of Spring Snowmelt Runoff on Aquatic Invertebrate Populations in a High Moutain Stream,
W75-04450 2I

Improved Instrumentation for Measuring Melted Precipitation on Windswept Topography,
W75-04655 7B

SODIUM
Deposition of Water and Cations on Artificial Foliar Collectors in Fir Krummholz of New England Mountains,
W75-04471 2K

SOIL CHEMICAL PROPERTIES
Micromorphology. A Discipline at the Chemistry-Minerology Interface,
W75-04608 2G

SOIL CHEMISTRY
Micromorphology. A Discipline at the Chemistry-Minerology Interface,
W75-04608 2G

SOIL CLASSIFICATION
The Classification of Some Nigerian Soils,
W75-04390 2G

SOIL CONDITIONS
Effects of Cattle Feedlot Manure on Crop Yields and Soil Conditions,
W75-04833 5D

SOIL DENSITY
The Effect of Soil Texture and Density on the Neutron and Density Probe Calibration for Some Tropical Soils,
W75-04549 2G

SOIL DISPOSAL FIELDS
Subsurface Sewage Disposal and Contamination of Ground Water in East Portland, Oregon,
W75-04798 5B

Rational Basis for Septic Tank System Design,
W75-04801 5D

Uniform Distribution in Soil Absorption Fields,
W75-04807 5D

SOIL FORMATION
The Classification of Some Nigerian Soils,
W75-04390 2G

SOIL LOSS
Raindrop Characteristics in South Central United States,
W75-04713 2B

SOIL MOISTURE
Range Plant Yield and Species Relationships in Natural and Partially Controlled Environments,
W75-04378 2I

The Temperature Profiles of Soil Columns During Infiltration,
W75-04389 2G

The Effect of Initial Moisture Content and Infiltration Quantity of Redistribution of Soil Water,
W75-04517 2G

A Nondestructive Method of Following Moisture Content and Temperature Changes in Soils Using Thermistors,
W75-04605 2G

Simulation of Moisture Transfer in Soils: One-Dimensional Infiltration,
W75-04695 2G

A Method for Measuring First-Stage Soil Water Evaporation in the Field,
W75-04698 2D

Two-Dimensional Water Infiltration from a Trench in Unsaturated Soils,
W75-04700 2G

Unsteady, Unsaturated, N-Dimensional Moisture Flow in Soil: A Computer Simulation Program,
W75-04701 2G

SOIL MOISTURE METERS
A Nondestructive Method of Following Moisture Content and Temperature Changes in Soils Using Thermistors,
W75-04605 2G

SOIL PHYSICAL PROPERTIES
Comparative Changes in Soil-Physical Properties Induced by Admixtures of Manures from Various Domestic Animals,
W75-04602 2G

Stress-Strain Response for Sand,
W75-04696 8D

SOIL PROFILE
The Effect of Large Applications of Manure on Movement of Nitrate and Carbon in an Irrigated Desert Soil,
W75-04370 5G

SOIL PROFILES
The Temperature Profiles of Soil Columns During Infiltration,
W75-04389 2G

SOIL PROPERTIES
Effect of Qualities of Irrigation Water and Fertilizers on Soil Properties, Yield and Nutrient Uptake by Wheat,
W75-04482 3F

SOIL STABILIZATION
Stabilization of Aeolian Lands in Saudi Arabia's Al Hasa Oasis,
W75-04512 3C

SOIL STRUCTURE
The Classification of Some Nigerian Soils,
W75-04390 2G

SOIL SURFACES
Polyvinyl Alcohol as a Stabilizer of Surface Soil,
W75-04607 2G

SOIL TEMPERATURE
Mechanism of Fire-Induced Water Repellency in Soil,
W75-04515 2G

A Nondestructive Method of Following Moisture Content and Temperature Changes in Soils Using Thermistors,
W75-04605 2G

SOIL TEXTURE
The Effect of Soil Texture and Density on the Neutron and Density Probe Calibration for Some Tropical Soils,
W75-04549 2G

SOIL TREATMENT
Characteristics and Soil Treatment of Biologically Treated Swine Wastes, Vol. I, CH.1 Thru 3,
W75-04623 5D

Characteristics and Soil Treatment of Biologically Treated Swine Waste, Vol II, Ch. 4, Thru 7,
W75-04624 5D

SOIL WATER
Use of Leaf Resistance for Predicting Irrigation Scheduling,
W75-04351 3F

The Influence of Soil Water Potential on the Perennial Vegetation of a Desert Arroyo,
W75-04365 2I

Calculation of the Drainage Component of Soil Water Depletion,
W75-04374 2G

Trickle Irrigation Soil Water Potential as Influenced by Management of Highly Saline Water,
W75-04391 2C

Oversaturation Method for Preparing Saturation Extracts for Salinity Appraisal,
W75-04392 2G

Polyvinyl Alcohol as a Stabilizer of Surface Soil,
W75-04607 2G

Micromorphology. A Discipline at the Chemistry-Minerology Interface,
W75-04608 2G

A Method for Measuring First-Stage Soil Water Evaporation in the Field,
W75-04698 2D

Feedlot Waste Effects on Soil Conditions and Water Evaporation,
W75-04699 5B

SOIL WATER DEFICIT
Susceptibility of Grain Sorghum to Water Deficit at Three Growth Stages,
W75-04483 3F

SOIL WATER MOVEMENT
Salt and Water Movement in Relatively Dry Soil,
W75-04516 2G

The Combined Effects of Infiltration and Redistribution on Leaching,
W75-04606 2G

Simulation of Moisture Transfer in Soils: One-Dimensional Infiltration,
W75-04695 2G

Two-Dimensional Water Infiltration from a Trench in Unsaturated Soils,
W75-04700 2G

Unsteady, Unsaturated, N-Dimensional Moisture Flow in Soil: A Computer Simulation Program,
W75-04701 2G

SOIL-WATER-PLANT RELATIONSHIPS
Use of Leaf Resistance for Predicting Irrigation Scheduling,
W75-04351 3F

Infiltration for Three Rangeland Soil-Vegetation Complexes,
W75-04377 2G

Range Plant Yield and Species Relationships in Natural and Partially Controlled Environments,
W75-04378 2I

Model for Predicting Plant Yield as Influenced by Water Use,
W75-04609 2I

Effect of Root Pruning on Water Relations and Growth of Cotton,
W75-04613 2I

SOIL WATER POTENTIAL
Evaluation of the Filter Paper Method for Estimating Soil Water Potential,
W75-04506 2G

Trickle Irrigation Soil Water Potential as Influenced by Management of Highly Saline Water,
W75-04507 2G

SOILS
Nitrogen Release Associated with the Decrease in Soil Organic Matter in Newly Cultivated Soils,
W75-04367 5B

Water Uptake by Seeds as Affected by Water Stress, Capillary Conductivity, and Seed-Soil Water Contact. I. Experimental Study and, II. Analysis of Experimental Data,
W75-04381 2I

Drainage for Agriculture,
W75-04537 3F

Water Management Systems,
W75-04538 3F

SOLAR ENERGY
Diurnal Temperature Distribution in Small Reservoir,
W75-04443 2H

SOLID ADSORBENTS
Solid Adsorbents for Gas and Liquid Treatment,
W75-04826 5D

SOLID WASTE COLLECTION
An Assessment of Wet Systems for Residential Refuse Collection: Summary Report,
W75-04577 5D

SOLID WASTES
Self-Reconditioning Filter Apparatus for Continuous Removal of Solids From a Stream of Liquid,
W75-04460 5D

Will Current Research Answer Today's Problems at the Sanitary Landfill.,
W75-04800 5B

SOLUBILITY
Determination of the Molecular Solubility of Navy Oils in Water,
W75-04722 5A

Solubility Studies of Metallic Mercury in Pure Water at Various Temperatures,
W75-04815 5A

SORGHUM
Use of Leaf Resistance for Predicting Irrigation Scheduling,
W75-04351 3F

SOUTH CAROLINA
Biologic Detection and Control of Water Pollution,
W75-04447 5C

Correlation of Hydrologic Model Parameters with Changing Land Use as Determined from Aerial Photographs,
W75-04448 4C

Fast Fluch System,
W75-04622 5D

SOUTHWEST U.S.
Management of Phreatophyte and Riparian Vegetation for Maximum Multiple Use Values,
W75-04379 3B

SPECIFICATIONS
Universal Design of a 2.5 MGD Universal Desalting Plant, Revised: Volume 1.
W75-04850 3A

SPECTROPHOTOMETRY
Solubility Studies of Metallic Mercury in Pure Water at Various Temperatures,
W75-04815 5A

SPRINGS
Controls on the Quality Variations of Some Carbonate Spring Waters,
W75-04710 2F

SPRINKLER IRRIGATION
Use of Leaf Resistance for Predicting Irrigation Scheduling,
W75-04351 3F

The Combined Effects of Infiltration and Redistribution on Leaching,
W75-04606 2G

ST. LOUIS (MO)
Inadvertent Rain Modification as Indicated by Surface Raincells,
W75-04703 2B

STABILITY
River Regime With Special Reference to River Nile,
W75-04706 2E

STANDARD SAMPLES
Microbiological Production of Geosmin,
W75-04561 5D

STATE POLICIES
An Evaluation of State Land Use Planning and Development Control in the Adirondacks,
W75-04445 6E

STATE POLICY
Aquatic Plant Control.
W75-04599 6E

Waterworks Department in Certain Cities.
W75-04774 6E

In Re Highway US-24, in Bloomfield Township, Oakland County (Highway Condemnation Proceeding).
W75-04776 6E

Bergen County Sewer Authority V. Hackensack Meadowlands Development Commission (Seeking Declaratory Judgment that Plaintiff not Subject to Land Use Regulations of Defendant in Constructing Addition to Sewage Plant).
W75-04780 6E

Hendrix, Et Al. V. Creel, Et Al. (Action for Injunction to Compel Municipal Corporation to Clear and Maintain Ditch).
W75-04782 6E

STATISTICAL METHODS
Modeling Sewage Treatment Plant Input BOD Data,
W75-04528 5D

A Possibility of Airflow - Precipitation Regime Investigations,
W75-04660 2B

Statistical Considerations About Snow Conditions in the Austrian Alps,
W75-04667 2C

STATISTICS
Spectra of Precipitation Series in Mountainous Regions,
W75-04682 7A

STEREO GAGES
Precipitation Measurements by Means of Storage Gauges with Stereo and Horizontal Orifices in the Baye De Montreux Watershed,
W75-04656 7B

STOCHASTIC PROCESSES
Expectation and Dispersion Matrices for the Estimation of Distributions Associated with Discrete Reservoirs,
W75-04525 4A

Modeling Sewage Treatment Plant Input BOD Data,
W75-04528 5D

STOCHASTIC RESERVOIR THEORY
Expectation and Dispersion Matrices for the Estimation of Distributions Associated with Discrete Reservoirs,
W75-04525 4A

STORAGE GAGES
Precipitation Measurements by Means of Storage Gauges with Stereo and Horizontal Orifices in the Baye De Montreux Watershed,
W75-04656 7B

Evaporation Losses from Storage Gauges,
W75-04657 7B

STORAGE REQUIREMENTS
A Method for Determining Peak Flows and Detention Storage Requirements in Urbanizing Areas.
W75-04694 4A

STORAGE TANKS
Surge Facility for Wet and Dry Weather Flow Control,
W75-04562 5D

STORM DRAINS
Evaluation Problem of Storm Water Routing Mathematical Models,
W75-04708 5D

Comprehensive Plan for Water, Sewer and Storm Drainage in the Lower Rio Grande Valley, (Volume II).
W75-04759 5D

STORM RUNOFF
Control Strategy Development Study, San Francisco Wastewater Master Plan,
W75-04352 5D

Study of Subsurface Flow Into Mountain Streams as Related to Topography and Partial (Variable) Source Areas,
W75-04357 4D

The Varying Source Area of Streamflow from Upland Basins,
W75-04358 4D

Water Quality of Storm Runoff from a Texas Beef Feedlot,
W75-04843 5B

STORM SURGES
Surge Facility for Wet and Dry Weather Flow Control,
W75-04562 5D

STORM WATER
Evaluation Problem of Storm Water Routing Mathematical Models,
W75-04708 5D

Sources of Metals in New York City Wastewater,
W75-04805 5B

STRAIN
Stress-Strain Response for Sand,
W75-04696 8D

STRAITS
Rotating Hydraulics of Strait and Sill Flows,
W75-04716 2L

STRAITS OF GIBRALTER
Rotating Hydraulics of Strait and Sill Flows,
W75-04716 2L

STRATIFICATION
Diurnal Temperature Distribution in Small Reservoir,
W75-04443 2H

STRATOSPHERE
Supersonic Aircraft and the Ozone Layer,
W75-04393 5A

STREAM CLASSIFICATION
The Use of Chironomid Pupal Exuviae for Characterizing Streams,
W75-04371 5B

STREAM PURIFICATION
Oxygen Sag and Stream Purification, (Literature Review),
W75-04849 5B

STREAMFLOW
Correlation of Hydrologic Model Parameters with Changing Land Use as Determined from Aerial Photographs,
W75-04448 4C

Water Yield as an Index of Lee and Windward Topographic Effects on Precipitation,
W75-04678 2B

STREET DRAINAGE
Hydraulic Analysis of Winnipeg Sump Inlets,
W75-04804 5D

STREPTOMYCES
Microbiological Production of Geosmin,
W75-04561 5D

STRESS
Stress-Strain Response for Sand,
W75-04696 8D

STRIP MINES
Acid Mine Water, A Bibliography,
W75-04625 5G

SUBFLOOR
Subfloor Monitoring of Shady Grove Dairy Liquid Manure Holding Pond,
W75-04640 5D

SUBIRRIGATION
Some Effects of Subirrigation on Bentgrass During Heat Stress in the Field,
W75-04612 2I

SUBMERGED LANDS ACT
Offshore Oil Drilling at Santa Barbara, Part 1,
W75-04784 6E

SUBSURFACE DRAINAGE
Development of Guidelines for the Design of Subsurface Drainage Systems for Highway Pavement Structural Sections,
W75-04809 8A

SUBSURFACE INVESTIGATIONS
The Rising Water Table in the West Nubarya Area of Egypt,
W75-04363 4B

SUBSURFACE RUNOFF
The Varying Source Area of Streamflow from Upland Basins,
W75-04358 4D

SUBURBAN AREAS
Farms are Not in the Country Any More,
W75-04546 5D

SUGARBEETS
Separation, Dewatering and Disposal of Sugarbeet Transport Water Solids, (Phase I),
W75-04565 5D

SULFATE-REDUCING BACTERIA
Interrelations Between Sulfate-Reducing and Methane-Producing Bacteria in Bottom Deposits of a Fresh-Water Lake. I. Field Observations,
W75-04469 5C

Interrelations Between Sulfate-Reducing and Methane-Producing Bacteria in Bottom Deposits of a Fresh-Water Lake. II. Inhibition Experiments,
W75-04470 5C

SURFACE DRAINAGE
The Rising Water Table in the West Nubarya Area of Egypt,
W75-04363 4B

SURFACE RUNOFF
The Development of a Mathematical Model to Predict Runoff Water Quality from Watersheds,
W75-04551 5B

SURFACE WATERS
Surface Water Quality is Influenced by Agricultural Practices,
W75-04548 5B

SURGE TANKS
Surge Facility for Wet and Dry Weather Flow Control,
W75-04562 5D

SURGES
Flood Plain Information - Cedar Bayou, Houston Metropolitan Area, Texas.
W75-04748 4A

Flood Plain Information--Coastal Flooding, City of Chesapeake, Virginia.
W75-04753 4A

SURVEYS
A systems Analysis of Water Quality Survey Design,
W75-04522 5B

SUSPENDED MATTER
Sphere Method Turbidimeter,
W75-04819 5A

SUSPENDED SOLIDS
Suspended Solids Carried by the Gallatin River of Southwestern Montana: Amounts Carried During Spring Runoff,
W75-04501 2J

SWAMPS
An Ecological Study of a Baldcypress Swamp in St. Charles Parish, Louisiana,
W75-04364 2H

SWEDEN
On the Problem of Vertical Distribution of Precipitation, Especially in Areas with Great Height Differences,
W75-04680 2B

SWEDEN (LAKE MALAREN)
The Effect of Cooling Water Discharges on Zooplankton in a Bay of Lake Malaren,
W75-04496 5C

SWINE
Management of Swine Waste by a Lagoon System,
W75-04632 5D

Test Swine Waste Disposal Systems,
W75-04637 5D

SWINE WASTEWATER
Characteristics and Soil Treatment of Biologically Treated Swine Wastes, Vol. I, CH.1 Thru 3,
W75-04623 5D

Characteristics and Soil Treatment of Biologically Treated Swine Waste, Vol II, Ch. 4, Thru 7,
W75-04624 5D

SWISS PREALPS
Factors Affecting the Estimate of Areal Average Summer and Winter Precipitation in a Small Catchment of the Swiss Prealps,
W75-04686 2B

SWITZERLAND (BAYE DE MONTREUX)
Precipitation Measurements by Means of Storage Gauges with Stereo and Horizontal Orifices in the Baye De Montreux Watershed,
W75-04656 7B

SYNOPTIC ANALYSIS
Estimate of Heat Fluxes on the Subjacent Surface (According to Data from Synoptic Analysis),
W75-04737 7C

SYSTEMS ANALYSIS
A systems Analysis of Water Quality Survey Design,
W75-04522 5B

TAIWAN
Precipitation in Taiwan Mountainous Areas,
W75-04675 2B

TAMARISK
Stabilization of Aeolian Lands in Saudi Arabia's Al Hasa Oasis,
W75-04512 3C

TECHNOLOGY
The Role of Water and Land Resources in Alleviating Malnutrition and Hunger in Arid Regions,
W75-04603 6B

TELEVISION INSPECTION
TV Inspections Slash Sewer Costs $300 per Repair,
W75-04830 5G

TEMPERATURE
Temperature Measurements and Internal Waves in Senaca Lake, New York,
W75-04400 2H

Reconstructing the Vertical Profile of Humidity on the Basis of the Vertical Profile of Temperature,
W75-04741 2B

TEMPERATURE AVOIDANCE
The Effect of Temperature and Chemical Pollutants on the Behavior of Several Esturine Organisms,
W75-04353 5C

TERRACING
A Balanced Approach to Resource Extraction and Creative Land Development Associated

with Open-Pit Copper Mining in Southern Arizona,
W75-04510 5G

TERRITORIAL SEAS (JURISDICTION)
Crisis in the South Pacific: Tunaboat Seizures,
W75-04649 6E

The Blockade 'Exception' To Territorial Water Jurisdiction,
W75-04766 6E

TERRITORIAL WATERS
Crisis in the South Pacific: Tunaboat Seizures,
W75-04649 6E

Jurisdiction in National Waters,
W75-04650 6E

The Marine Environment and Toxic Substances (When was the Last Time You had a Good Swordfish Steak),
W75-04768 6E

TERTIARY TREATMENT
Granular Filters for Tertiary Wastewater Treatment,
W75-04429 5D

Tertiary Treatment: The Wrong Solution to a Non-Problem,
W75-04811 5D

TESTS
Analyzing Biological Properties of Wastes,
W75-04842 5A

TEXAS
The Effects of Mercuric Chloride Upon Respiration in Congeria Leucophaeta,
W75-04472 5C

Special Flood Hazard Information: Cypress Creek, Harris County, Texas.
W75-04742 4A

Special Flood Hazard Information: Clear Creek, Brazoria, Fort Bend, Galveston and Harris Counties, Texas.
W75-04743 4A

Flood Plain Information -- Williamson Creek, Austin, Texas.
W75-04747 4A

Flood Plain Information -- Goose Creek, Baytown, Texas.
W75-04750 4A

Comprehensive Plan for Water, Sewer and Storm Drainage in the Lower Rio Grande Valley, (Volume II).
W75-04759 5D

Nueces River Project, Texas, Part 1.
W75-04786 6E

Authorizing the City of Sherman, Tex., to Construct a Barrier in Denison Dam (Lake Texoma) Red River, Tex. and Okla., for the Purpose of Providing a Municipal and Industrial Water Supply.
W75-04789 6E

Water Quality of Storm Runoff from a Texas Beef Feedlot,
W75-04843 5B

Surface Water Data of the Llano Texas Region, Project Sanguine.
W75-04847 2E

THERMAL CONDUCTIVITY
The Temperature Profiles of Soil Columns During Infiltration,
W75-04389 2G

A Nondestructive Method of Following Moisture Content and Temperature Changes in Soils Using Thermistors,
W75-04605 2G

THERMAL POLLUTION
The Effect of Temperature and Chemical Pollutants on the Behavior of Several Esturine Organisms,
W75-04353 5C

Biologic Detection and Control of Water Pollution,
W75-04447 5C

Abundance, Diversity and Seasonal Patterns of Estuarine Fish Populations,
W75-04485 5C

Influence of Heated Discharge Waters from the 'Skawina' Electric Power Station on the Ichthyofauna of the Rivers Skawinka and Vistula,
W75-04491 5C

The Effect of Cooling Water Discharges on Zooplankton in a Bay of Lake Malaren,
W75-04496 5C

An Experimental Study of the Free Surface Effect on a Buoyant Jet,
W75-04559 8B

THERMAL RADIATION
The Problem of Calculating Cloud Cover in Calculations of Long Wave Radiational Characteristics of the Atmosphere,
W75-04740 2B

THERMOCLINE
Diurnal Temperature Distribution in Small Reservoir,
W75-04443 2H

THUNDERSTORMS
Extreme Thunderstorm Rainfall in the Intermountain Western United States,
W75-04677 2B

TILE EFFLUENTS
The Unreliability of Tile Effluent for Monitoring Subsurface Nitrate-Nitrogen Losses from Soils,
W75-04438 5B

TIME SERIES ANALYSIS
Modeling Sewage Treatment Plant Input BOD Data,
W75-04528 5D

Spectra of Precipitation Series in Mountainous Regions,
W75-04682 7A

The use of the Modified Time Series Analysis Technique for The Determination of Areal Precipitation Accuracies,
W75-04683 2B

TOPOGRAPHY
Characteristics of Precipitation in the Scottish Highlands,
W75-04661 2B

TORNADOES
Tornado or Dust Devel: The Enigma of Desert Whirlwinds,
W75-04372 2B

TORONTO (CANADA)
A Compendium of Information, (The Metropolitan Toronto and Region Conservation Authority).
W75-04760 3D

TOXICITY
Medical Uses of Isotopes,
W75-04417 5C

TRACE ELEMENTS
Trace Metals in Wastewater Effluents,
W75-04806 5B

TRACER TECHNIQUES
Identification and Evaluation of Water Tracers Amenable to Post-Sampling Neutron Activation Analysis,
W75-04355 5A

TRACERS
Identification and Evaluation of Water Tracers Amenable to Post-Sampling Neutron Activation Analysis,
W75-04355 5A

TRACTIVE FORCES
Soil Erosion and Sediment Transport from Gullies,
W75-04707 2J

TRANSFORMATIONS
Mercury in Aquatic Systems: Methylation, Oxidation-Reduction, and Bioaccumulation,
W75-04570 5B

TRANSMUTATION
High-Level Radioactive Waste Management Alternatives - Section 9: Transmutation Processing,
W75-04409 5D

TRANSMUTATIONS
High-Level Radioactive Waste Management Alternatives.
W75-04402 5D

TRANSPIRATION
Changes in Transpiration, Net Carbon Dioxide Assimilation and Leaf Water Potential Resulting from Application of Hydrostatic Pressure to Roots of Intact Pepper Plants,
W75-04399 3F

Silicon Content of Wheat Husks in Relation to Water Transpired,
W75-04484 2D

Effect of Leaf Area Reduction on the Water Requirement of Barley (Hordeum Vulgare L.),
W75-04511 2I

TRANSPIRATION CONTROL
Effect of Leaf Area Reduction on the Water Requirement of Barley (Hordeum Vulgare L.),
W75-04511 2I

TRANSPORTATION
High-Level Radioactive Waste Management Alternatives - Section 5: Ice Sheet Disposal,
W75-04405 5D

High-Level Radioactivity Waste Management Alternatives - Section 8: Extraterrestrii Disposal,
W75-04408 5D

A Regional Model of the Future Demand For Transportation: The Case of Barge Transportation,
W75-04520 6A

TRAP EFFICIENCY
Sediment Trap Efficiency of Small Reservoirs,
W75-04702 2J

TREATIES
Crisis in the South Pacific: Tunaboat Seizures,
W75-04649 6E

Jurisdiction in National Waters,
W75-04650 6E

TREATMENT FACILITIES
Computer Control of Chemical Addition at a Water-Treatment Plant,
W75-04535 5F

TREND SURFACE FITTING
Estimating Areal Rainfall by Fitting Surfaces to Irregularly Spaced Data,
W75-04693 7C

TREYNOR (IOWA)
Soil Erosion and Sediment Transport from Gullies,
W75-04707 2J

TRICKLE IRRIGATION
Trickle Irrigation Soil Water Potential as Influenced by Management of Highly Saline Water,
W75-04391 2C

Trickle Irrigation Soil Water Potential as Influenced by Management of Highly Saline Water,
W75-04507 2G

TRICKLING FILTERS
Trickling Filtration of a Waste Containing NTA,
W75-04427 5D

Apparatus for the Filtration and Biological Purification of Contaminated Water,
W75-04454 5D

TRISODIUM CARBOXYMETHYLOXYSUCCINATE
Biodegradability of a Carboxymethyloxysuccinate Detergent Builder,
W75-04426 5D

TRITIUM
Radiocarbon, Carbon-13 and Tritium in Water Samples from Basaltic Aquifers and Carbonate Aquifers on the Island of Oahu, Hawaii,
W75-04441 2F

TROPICAL SOILS
The Effect of Soil Texture and Density on the Neutron and Density Probe Calibration for Some Tropical Soils,
W75-04549 2G

TRULOPSIS AUSTROMARINA
Torulopsis Austromarina Sp. Nov. A Yeast Isolated from the Antartic Ocean,
W75-04436 5A

TRUCKEE RIVER (NEV-CALIF)
Numerical Simulation of Unsteady Flow Hydraulics of Truckee River,
W75-04444 6A

TUBE-WELLS
Demand for Irrigation: A Case Study of Government Tube-Wells in Uttar Pradesh,
W75-04529 6D

TURBIDIMETERS
Sphere Method Turbidimeter,
W75-04819 5A

TURBIDITY
Suspended Solids Carried by the Gallatin River of Southwestern Montana: Amounts Carried During Spring Runoff,
W75-04501 2J

Sphere Method Turbidimeter,
W75-04819 5A

TURBIDITY REMOVAL
Turbidity Removal Using Polymers and Activated Carbon,
W75-04820 5F

TURBULENCE
Tornado or Dust Devel: The Enigma of Desert Whirlwinds,
W75-04372 2B

An Experimental Study of the Free Surface Effect on a Buoyant Jet,
W75-04559 8B

A Critical Examination of the Turbulence Instrument used in the Marsta Micro-Meteorological Field Project,
W75-04795 7B

TURF GRASSES
Some Effects of Subirrigation on Bentgrass During Heat Stress in the Field,
W75-04612 2I

ULTRAVIOLET RADIATION
Solubility Studies of Metallic Mercury in Pure Water at Various Temperatures,
W75-04815 5A

UNITED KINGDOM
Orographic Influences on the Distribution of Precipitation,
W75-04676 2B

UNITED KINGDOM (RIVER CHEW)
The Use of Chironomid Pupal Exuviae for Characterizing Streams,
W75-04371 5B

UNITED STATES
ASCE Urban Water Resources Research Program, 1967-1974,
W75-04440 4A

Directory of Environmental Life Scientists,
W75-04468 6G

Jurisdiction of Submerged Lands--Guam, the Virgin Islands and American Samoa.
W75-04783 6E

UNIVERSITIES
Planning, Management and Accountability in Water Resources Research,
W75-04439 6B

Tenth Annual Report, Program Activities, July 1, 1973 - June 30, 1974.
W75-04654 9D

UNOX SYSTEM
Environment, Energy Costs Suggest Oxygen Activated Sludge as Wastewater Treatment Approach,
W75-04827 5D

UNSATURATED FLOW
Simulation of Moisture Transfer in Soils: One-Dimensional Infiltration,
W75-04695 2G

Two-Dimensional Water Infiltration from a Trench in Unsaturated Soils,
W75-04700 2G

UNSATURED FLOW
Unsteady, Unsaturated, N-Dimensional Moisture Flow in Soil: A Computer Simulation Program,
W75-04701 2G

UNSTEADY FLOW
Numerical Simulation of Unsteady Flow Hydraulics of Truckee River,
W75-04444 6A

URBAN HYDROLOGY
A Method for Determining Peak Flows and Detention Storage Requirements in Urbanizing Areas.
W75-04694 4A

URBAN MAPPING
Investigation of Land Use of Northern Megalopolis Using ERTS-1 Imagery,
W75-04726 7C

URBAN RAINFALL
Inadvertent Rain Modification as Indicated by Surface Raincells,
W75-04703 2B

URBAN RUNOFF
The Development of a Mathematical Model to Predict Runoff Water Quality from Watersheds,
W75-04551 5B

A Method for Determining Peak Flows and Detention Storage Requirements in Urbanizing Areas.
W75-04694 4A

URBAN WATER RESOURCES
ASCE Urban Water Resources Research Program, 1967-1974,
W75-04440 4A

URBANIZATION
The Brandywine: Five Years After,
W75-04360 6B

Regulation of Urban Development to Control Runoff and Erosion,
W75-04362 4D

ASCE Urban Water Resources Research Program, 1967-1974,
W75-04440 4A

Correlation of Hydrologic Model Parameters with Changing Land Use as Determined from Aerial Photographs,
W75-04448 4C

A Method for Determining Peak Flows and Detention Storage Requirements in Urbanizing Areas.
W75-04694 4A

USSR
Snow Survey and Methods for Snow Storage Estimation in Mountain River Basins of the Soviet Union,
W75-04659 2C

USSR (VARZOB RIVER BASIN)
Analysis of Snow Cover Distribution from Aerophotography Data Over Experimental Mountain Basin of Varzob River,
W75-04658 7B

USSR (VITIM RIVER BASIN)
Methods for the Study of Laws for the Distribution of Precipitation in Medium-High Mountains (Illustrated by the Vitim River Basin),
W75-04669 2B

UTAH
Economics of Fertilizer Application on Range and Meadow Sites in Utah,
W75-04388 2I

Relation of Orographic Winter Precipitation Patterns to Meteorological Parameters,
W75-04670 2

A Hybrid Computer Simulation Model for Predicting the Effects of the Areal Distribution of Precipitation on Runoff Characteristics,
W75-04692 2B

Planning for Water Quality in the Bear River System in the State of Utah.
W75-04757 5G

VALUE ENGINEERING
Evaluation Problem of Storm Water Routing Mathematical Models,
W75-04708 5D

VARIABILITY
Simple Albedo Feedback Models of the Icecaps,
W75-04794 2C

VEGETATION EFFECTS
Distribution of Different Forms of Nitrogen in Some Desert Soils,
W75-04373 2G

Energy Budget Measurements Over Three Cover Types in Eastern Arizona,
W75-04383 2I

VERMONT
Zahn, ET AL. V. International Paper Co. (Class Action Seeking Damages from Discharges),
W75-04588 6E

VERTICAL DISTRIBUTION
Reconstructing the Vertical Profile of Humidity on the Basis of the Vertical Profile of Temperature,
W75-04741 2B

VIRGIN ISLANDS
Jurisdiction of Submerged Lands--Guam, the Virgin Islands and American Samoa.
W75-04783 6E

VIRGINIA
Flood Plain Information: North Fork Rivanna River, Albemarle County, Virginia.
